

Full Prevention: "the depletion of Oxygen"

The fire protection industry has gone through an evolutionary technology process during the last four decades. During my professional career I had the pleasure and the privilege of being among the first to introduce these outstanding developments to the Italian fire fighting industry. The guiding theme for these developments has been the protection of people, buildings and goods in the most effective manner.

Until recently, our focus was to discover a fire as quickly as possible and to extinguish it effectively. Technological progress, careful and meticulous studies during these decades made it possible to greatly reduce the risk of fires in general.

However, a new method, based on the depletion of Oxygen, has opened completely new venues for us. We are now able to create fully protected environments and to completely eliminate the fire hazard by changing the atmosphere within a building by allowing full access to people at the same time.

It is a revolution that finally, after decades of refining and re-inventing fire extinguishing technology again and again, the same maybe obsolete in many cases. Thanks to a radical change of perspective, we now eliminate the possibility of a fire to get started instead of thinking about how to fight the fire.

Ing. Leonardo Corbo

lowerdent

Prevention is better than being sorry

All traditional fire fighting technologies or methods have the same problem in common, they are being used once the damage has occurred already. Whatever media is in use, foam, water mist, sprinklers, gas or water they are being activated or used after a fire has been detected. With the common and known methods fire is being fought only reactively. Often the damage caused by the extinguishing media is worse than the damage caused by the fire itself. Furthermore, there are many applications such as Data Centers, Server Rooms, Cold Stores, Paper Mills and many more where the usage of water or gas would be fatal in its consequence. Whenever electricity comes into play the usage of water could end in a total disaster. Huge storages like cold store could not be flooded from a gas reservoir for example. Isolcell aims to provide the optimal solution for most of the above-mentioned applications to ensure absolute security by simply making the development of a fire impossible.

"Completely eliminating the fire hazard and safeguarding people, buildings and it's content is possible with Isolcell's N, Firefighter oxygen depletion systems."

Over 55 years of sophistication

ISOLCELL: from pioneer to international technology leader

We were the first in Europe who developed and applied a technique that allowed generating a Controlled Atmosphere within a building. In 1958 we started studying these technologies and shortly after we created the first plants with a controlled atmosphere for preserving food. From here it was the logical consequence to extend the field of usage into various industries where a controlled atmosphere was of advantage to the quality of goods and the process of manufacturing, from pharmaceuticals to chemicals, from plastic moulding to oenology or laser cutting. But also for fire prevention or the conservation of artistic heritage. In the field of Controlled Atmosphere Isolcell is acknowledged to be the world leader. As part of an industrial group that owns "Finanziara Unterland", Isolcell S.p.A. is

being represented around the globe by a network of accredited distributors and resellers. Needless to say that we are ISO 9001, ISO 14001 and OSHA 18001 certified and that our range of products and systems naturally comply with the strictest European and International Directives.

We offer to our customers highly customized and reliable solutions based on state of the art technologies.

A natural affinity to improvement and evolution 1950 > 1960 > 1970 > 1980 > 1990 > 2000 > 2015 >

Our story is closely linked to development of controlled atmosphere technologies. Our experience is our capital for steady improvements and for the creation of innovative technologies.

Our solutions reflect the demands of the market and are reference for new technological standards.

The '50s

> 1958

Formation of Isolcell's first head office in Bolzano, Italy. In Trentino Alto Adige the first storages (cells) with controlled atmosphere for apples and pears were created. The very first gastight storages were fitted with bituminized aluminum foil, glued onto polystyrene panels.

Isolcell introduces the technology for the manual Volumetric Analysis of 02 and Co2 by the ORSAT method.

In 1960, absolute tightness of the refrigeration cells is being achieved by the revolutionary method of using polyester resin reinforced with fiberglass.

The '60s

> 1961

Isolcell presents exclusively the first adsorber for "carbon dioxide in diethanolamine" automatically regenerated by applying heat, produced by Hall Thermotank, UK. Two years later we start manufacturing the adsorber under license. The strong demand for our products encourages us to focus on exports, and to conquer country by country throughout Europe. In 1963 we developed the first CO2 adsorber based on a solution of potassium carbonate.

1965

In partnership with "Sulzer, Switzerland", the first adsorber for CO2 in Regenerated cold active carbons is being developed. This machine revolutionizes the CO2 adsorbtion technology, its principal is still the basis for modern and upto-date scrubbers.

1969

 Isolcell designs DEOXO, a combustion catalytic converter for decreasing the O2 content in the fruit conservation cells.

The '70s

> 1970

We refine our catalytic technology by increasing its efficiency and we create an open cycle propane combustion, ISOGEN. With this technology we are the first in Italy producing pre fabricated steel-polyurethane-panels for the quick and easy erection of cold stores with controlled atmosphere. Simultaneously we develop an innovative acrylic resin with unique characteristics, high elasticity, mechanical resistance, and easy to apply to achieve gas impermeability. Isolcoat is a well recognized and highly demanded sealant, even today.

> 1972

Isolcell develops the first state of the art ultrasonic paramagnetic analyser for accurate measuring of oxygen and carbon dioxide. Isolcell introduces automation of A.C. plants by the use of electro mechanical programming boards.

The head quarter moves from Bolzano to Laives, our current location.

> 1978

We are the first in Europe using a low oxygen level atmosphere to

disinfect food without using chemicals. This method will evolve to

become the worlds standard for ecological disinfections.

The '80s

> 1980

Isolcell introduces the first combustion generator applied with a decarbonizer downstream of the combustion process of its ISOGEN nitrogen generators thus being able to produce nitrogen without carbon dioxide resedues. This evolutionary feature is an inherent part of all machines from now on and as of it's appreciation by customers world wide it will last to end of the 90's.

> 1982

In the USA a new technology based on the principal of molecular separation of the air has been discovered. Isolcell are the first to introduce this revolutionary technology to Europe and creates the first N2 separator for molecular filtration by using a hollow fiber nitrogen generator.

Isolcell are the first to introduce the ULO (ultra low oxygen) method for the fruit conservation market. Compared to the classic refrigeration conservation extremely low levels of Oxygen now triple the shelf life of fresh fruit in cold storages. With the introduction of Personal Computers Isolcell are the first to monitor, control and to manage A.C. plants fully electronically.

After the appearance of the first publications about the effect of ethylene gas on the aging process of fruit and vegetables lsolcell starts producing its own range of chemical scrubbers and catalytic ethylene generators.

> 1984

We are the first in the world to utilize the Controlled Atmosphere Technologies in the fresh fruit maritime transport industry. Isolcell starts producing the first molecular sieve nitrogen generators with PSA (Pressure Swing Adsorbtion) technology.

The '90s

> 1990

The outstanding success of our PSA systems encourages us to re-design our product line making it modular and scalable. For the innovative system of regenerating carbon dioxide adsorbers with nitrogen we get a patent granted.

The State Monopoly chooses our technique and builds the first plant for disinfecting tobacco environmentally friendly by eliminating tobacco infesting parasites without the use of chemicals.

> 1994

Another patent is being granted. Isolcell introduces the first low pressure and low energy consuming VSA (Vacuum Swing Adsorbtion) system.

We enter the wine industry by proposing our nitrogen generators.

> 1998

Isolce

The new oxygen adsorber "Adox" is being developed and patented.

It is the evolution of the VSA, a system that until today is unbeaten in it's energy efficiency. Wherever the oxygen level needs to be lowered in conjunction with maximum efficiency "Adox" is the preferred solution.

> 2000

The 2000a

We extend the range of our ethylene adsorbers by developing "DEOXYL L.E." (Low Energy) in order to achieve maximum energy efficiency an to reduce the amount of heat in the fruit storage cells.

> 2001

For the archeological museum in Bolzano (Ötzi), Isolcell develops the concept for the "full protection of historical and artistic discoveries" and the first show room with protective atmosphere emerges.

Beside the control of temperature, relative humidity and residual oxygen the content of dust and bacterial charge within the show room can be reduced.

> 2003

In the field of fruit conservation Isolcell introduces and patents the concept of DCA (DynamicControlled Atmosphere) by assessing fluorescence emissions, the spontaneous emission of light. We are selected to be the worldwide exclusive partner of the Canadian Government for supplying this technology.

For the removal of CO2 the IS, Intelligent Scrubber, line is being developed. Thus providing more performance and the ability of maintaining so far unthinkable low levels of atmosphere within the DCA storage. The Industry Division is born. Further active carbon scrubbers are being developed.

> 2005

With the establishment of the "Fire Prevention Division" a new area of application has been entered. The N2 Firefighter system, a modular range of nitrogen generators, provides the most efficient oxygen depletion method for protecting the environment, people and property from fire.

> 2009

After four years, going through tough certification processes, the N2 Firefighter Technology is being recognized and certified according to the European Regulations. Isocell is being acknowledged as a certified manufacturer and Installer for fire prevention and security systems.

> 2012

Isolcell revolutionizes the fruit conservation market again by introducing ECO, a high efficiency carbon dioxide adsorber. Compared to previous generations it reduces the energy consumption by 50%, its efficiency defines new standards in the market. At the same time we lodge another patent, with the "staggered counters operation method" that allows partitioning within the PSA technology we reduce substantially the power consumption and achieve an improved flow of nitrogen.

> 2013

GEN2ION, an innovative low oxygen paint system that guarantees considerable reductions of costs of painting and improves the treated surface significantly is being improved further.

> 2015

Isolcell introduces DAN2TE (Dynamic Atmosphere Nitrogen Treatment Equipment) to disinfect and conserve historical artwork.

FIRE PREVENTION division N₂ FIREFIGHTER[®], oxygen depletion

Treating and controlling the atmosphere has been our business for over 55 years. New techniques have been developed, outstanding innovations have paved our way. The experience gained in over 55 years has inspired us to develop the ${}_{m}N_{2}$ **Firefighter**["] oxygen depletion fire prevention system which enables us to generate and to control an atmosphere in which a fire cannot get started. ${}_{m}N_{2}$ **Firefighter**["] oxygen depletion fire prevention process, change the ratio of gases normally present in the air we breath, thus creating a perpetually self-extinguishing atmosphere. As no chemicals or other artificial additives are being added in this process this prevention method is absolutely environmentally friendly and safe to human beings. Therefore you may call it: "Green technology"

ONLY TECHNOLOGY THAT PREVENTS A FIRE TO GET STARTED PROTECTION 24/7/365 NO AESTHETIC DISTURBANCES INSIDE THE PROTECTED AREA ENVIRONMENTALLY SUSTAINABLE SIMPLE INSTALLATION EVEN IN ENVIRONMENTS SUBJECT TO STRONG REGULATION RESTRAINS VERY LOW ENERGY CONSUMPTION MANAGEMENT AND MAINTENANCE FRIENDLY EASY INTEGRATION TO EXISTING FIRE PANELS AND/OR BUILDING MANAGEMENT SYSTEMS

Examples of fires protected with traditional extinguishing systems: the environment has not been safeguarded.

"Prevention" the better method

All traditional and known fire-fighting methods have got one thing in common: they are passive and react only once the fire has started and the damage has occurred. What the fire has not managed to destroy, huge amounts of water applied by hoses or by sprinkler systems will do. Gas extinguishing systems also depend on the fire to have started before they can be activated. The release of the gas with extreme high pressures can cause structural damages to the building or to the protecting worth equipment, the extinguishing media used can probably cause environmental damages or produce health and life threatening circumstances. Malfunction of the extinguishing system can threaten people, cause loss of production, loss of clients and subsequently loss of the business. Therefore: "Prevention" is the better method. It is always active, it does not need to react.

The "**N2 Firefighter**" system completely eliminates the fear of fire, as the environment created does not allow a fire to get started from the very beginning.

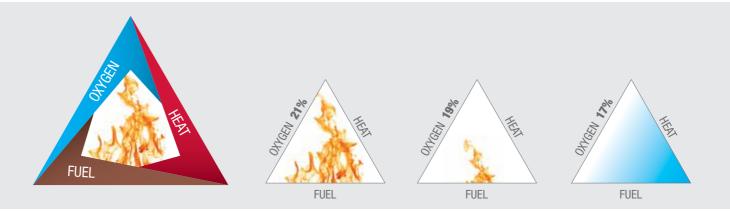

The **"N2 Firefighter"** system Highly reliable, flexible, scalable and suitable for:

COOL STORES AUTOMATED HIGH BAY WAREHOUSES AMBIENT TEMPERATURE WAREHOUSES LIBRARIES AND ARCHIVES MUSEUMS DATA CENTERS SERVER ROOMS PETROCHEMICAL AND PHARMACEUTICAL INDUSTRY HOSPITALS ETC.

Concept The generated and controlled atmosphere makes a fire impossible

For a fire to ignite three elements are needed: Heat, combustibles and an oxidizing agent, usually oxygen. When these elements are present and in the right mixture a natural fire will occur.

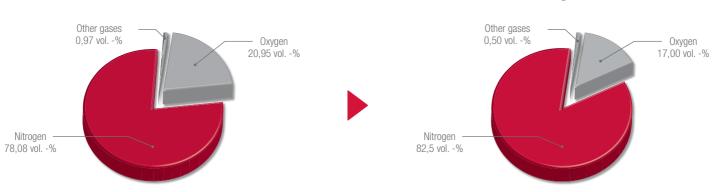

A fire can be prevented or extinguished by removing any one of these elements. Once a fire has started, the exothermic chain reaction sustains the fire and allows it to continue until or unless at least one of the elements of the fire is blocked. Traditional fire fighting methods either deny the burning fire the oxygen it needs or they lower the temperature of the fuel below the ignition point or by creating a barrier of inert gases thus attacking the chemical reaction responsible for the fire.

With the "N₂ Firefighter" we actively prevent the combustion process to get started by uninterruptedly reducing the amount of oxygen.

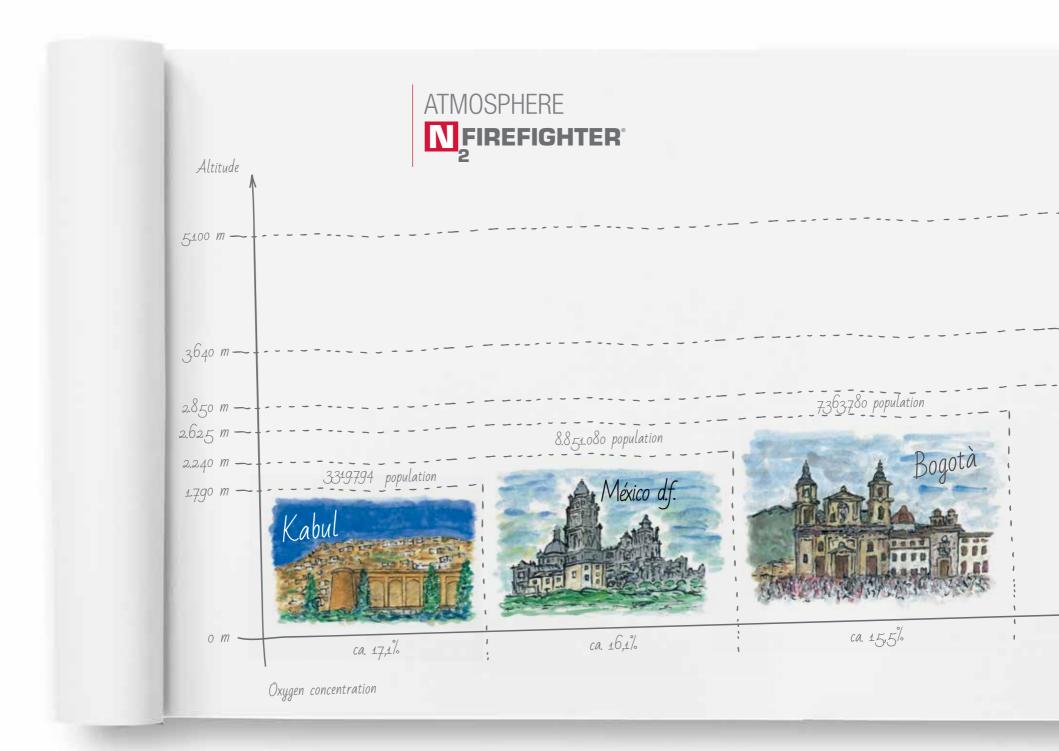

You Tube

When we talk about the air we breath we often and falsely talk about oxygen. In fact, the air we breath consists of 78,08 Vol.% of nitrogen und only 20,95 Vol.% of oxygen (0,93 Vol.% Argon and 0,04 Vol.% CO2). This ratio between nitrogen and oxygen is the same all over the world, high up in the mountains or low down at the sea. The food every fire needs to burn is the oxygen supplied by nature. By modifying the atmosphere and changing the ration between these to ingredients N2 Firefighter denies the fire enough "food" to get established. The changed ratio has got the equivalent effect to human beings as a stay in high altitude or when travelling by plane as the lower air pressure drives the molecules apart and the amount of oxygen inhaled with every breath is less than in lower atmospheres.

ATMOSFERA N₂ FIREFIGHTER®

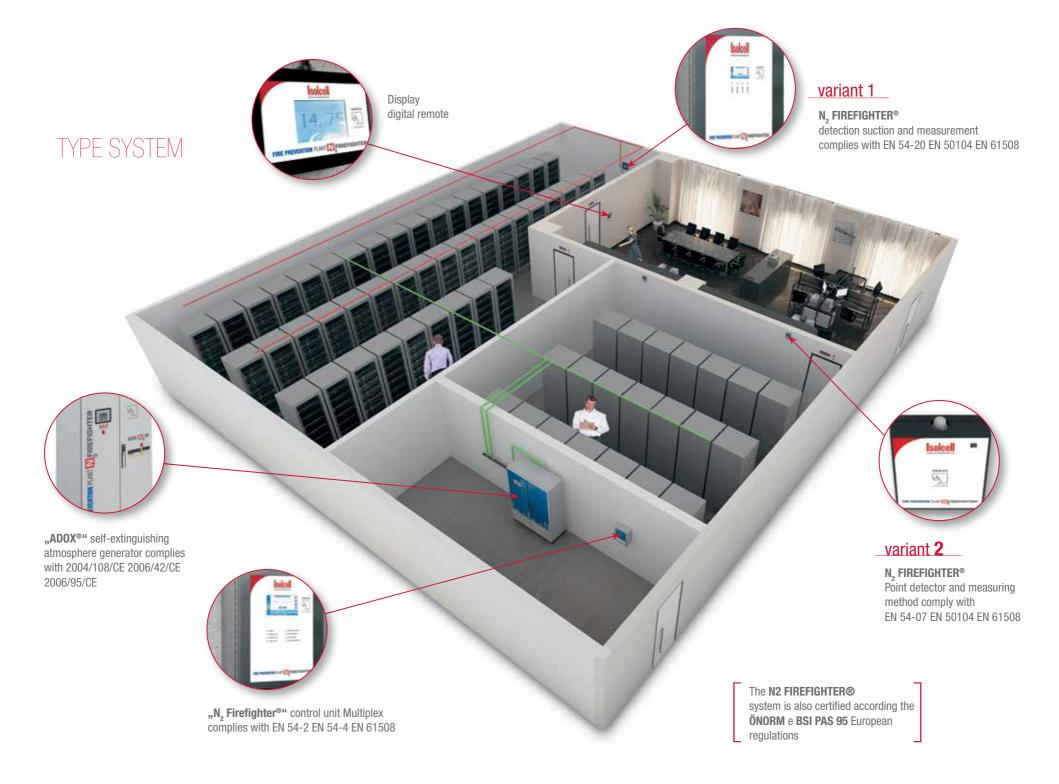

N₂ FIREFIGHTER[®] system GENERATE, INTRODUCE, MAINTAIN

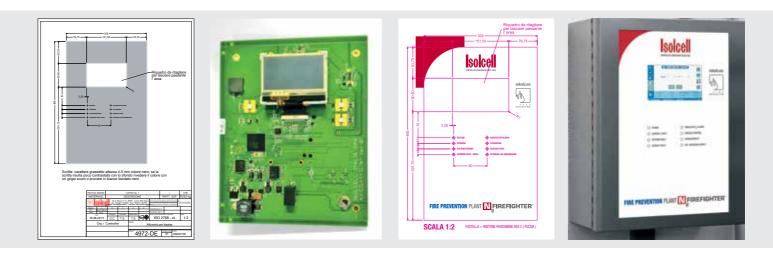

Technology Made by Isolcell

ALL COMPONENTS OF OUR N2 FIREFIGHTER SYSTEMS HAVE BEEN DESIGNED, DEVELOPED AND MANUFACTURED BY ISOLCELL. WE ARE THE ONLY CERTIFIED COMPANY IN ITALY THAT DESIGNS AND INSTALLS COMPLETE OXYGEN DEPLETION FIRE PREVENTION PLANTS.

Technology Made by ISOLCELL FROM DESIGN TO PRODUCTION

Using special self-generating filters, with the ADOX N2FF, Isolcell has developed a modular system for gaining nitrogen in a most ecological and very low energy consuming process. The ratio between O2 and N2 in the air of the area to be protected is being changed without using additives. The result is "air", odorless, colorless clean and fresh, except it does not allow a fire to develop.

Adox, a patented system, was designed for heavy duty usage (24/7/365) being extremely moderate in energy consumption at the same time, thus being benchmark in its economy for nitrogen self-producers.

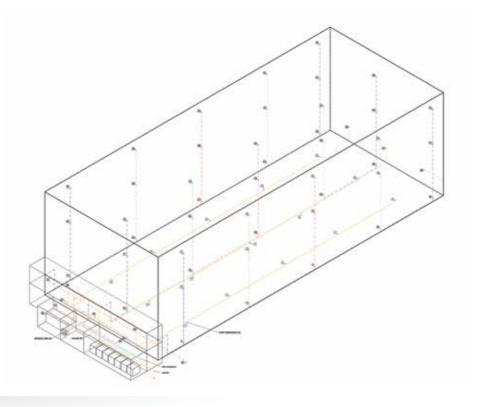

Great Flexibility Size doesn't matter, we protect from the smallest repository to the largest volumes

Variable pitch, virtual grid

In opposite to conventional oxygen control systems where the O2 content of a protected area is solely measured along the outside walls, Isolcell N2Firefighter uses the variable pitch and virtual grid method. This method delivers the most accurate and most reliable measurements possible as the protected volume is being divided into virtual cubes and the oxygen is being analyzed and controlled throughout the whole area at different heights, lengths and widths. (see illustration) At the same time, the nitrogen will not be delivered into the area by a single or double point only but through a "T-connected" distribution network. The "T" points of the N2 pipe work equipped with automatic valves are controlled by the CIE (Control Indicating Equipment) that monitors and manages each component of the N2Firefighter prevention system.

Benefits:

- N, being injected only where needed results in reduction of energy consumption
- Homogeneous distribution of self-extinguishing atmosphere
