Garland Hydrangea Runaway Bride® and French Bolero® - 13 centimetre pot size

Cultivaris GmbH now announces that as of IPM 2025, these varieties will also be available in 13 centimetre / 5" branded pots, which can be sourced from the network of licensed growers. With this new product size, new retail opportunities will be created, but also new applications for the product at the consumer level, in particular for patios and terraces – as attractive solo pots, but also in combination with perennials, grasses, ornamental shrubs and bedding plants.

In addition to this new product form that is ideally suited for mass-retail channels, Cultivaris GmbH also emphasizes the increasing interest and importance of special product forms such as pyramids and hanging baskets. Due to their growth habit and profuse flowering, Garland Hydrangeas are ideally suited for these applications and offer hydrangea enthusiasts eye-catching and highly attractive alternatives to standard hydrangeas.

3D Armour erosion control mat

Geomat is an organic product shaped as a waterproof three dimension erosion controlling carpet. This carpet will strengthen the subsoil 's endurability, to avoid landslide and erosion potential. It is made of geosynthetic material, like a polymer fiber, it is handy to overcome technical challenges in constructions and infrastructure's maintenance.

Three dimensional structures in Geomat are useful to protect the soil's surface and plants' root sprout can still grow without being disturbed. To enforce the slope's strength, Geomat installation has to be accompanied with Geoscience and Geotextile. All those substances can be applied easily without special equipment or expert workers.

Geomat's main functions are to stabilize the soil, controlling the erosion, linear protection, environment recovery as well as construction projects' special application. For example, fireproof Geomat is used in fire risk protection projects, while permeable Geomat is used for sustained drainage.

Double flowered Hydrangea macrophylla varieties Felina ?, Florentina?, Feather? and Flame?

A clear focus of Hydrangea Breeders Association BV (HBA) currently lies in the breeding of double flowered hydrangeas. In addition there is also a focus on the plant production for the grower and a lasting joy to the end user. Some breeding goals here are the naturally compact growth, the total plant structure, stability of the shoots and the keeping quality at the consumer.

This year, the HBA presents four new macrophylla varieties, two mophead hydrangeas: **Felina?**, **Florentina?** and two lacecap hydrangeas: **Flame?** and **Feather?**. These differ in the individual flower size and the color gradient in the maturation process. The novelties combine very well in production characteristics with the other HBA varieties.

Features:

Felina? 'H217901'

Double flowered mophead Hydrangea, compact growth, strong shoots, very good branching, well suited for 9.5 to 17 centimetre pots, color: light pink / light blue

Florentina? 'H217902'

Double flowered mophead hydrangea with large sepals, middle growth, strong shoots, very good branching, good for small and larger pots, color: light pink / light blue

Flame? 'H217903'

Double flowered Lacecap hydrangea with large sepals, strong growth, strong shoots, very good branching, good for larger pots, does not moult, color: pink / blue

Feather? 'H217904'

Double flowered Lacecap hydrangea, strong growth, strong shoots, very good branching, also suitable for small pots, does not moult, color: pink / blue

CultiMesh wireless mesh platform

CultiMesh is your next step towards autonomous growing: With CultiMesh, Food Autonomy Lighting is answering the needs of growers to control luminaires easily and quickly with an affordable wireless solution.

However, CultiMesh goes far beyond being a wireless dimming system for lighting fixtures. It is a high-tech, two-way communication platform that creates an indoor, high-precision positioning system that is opening new possibilities in dynamic lighting and other automated greenhouse operations.

Benefits

- | cost-effective, plug and play installation
- | control thousands of luminaires in less than a second
- | fully compatible with all major climate computers
- | collects and logs data, sends notifications, provides reports
- | optimizes lighting for plants and employees with multi-spectrum, tracks robots for efficient operation
- | easily customizable for growers needs
- | user-friendly multipurpose platform tested by growers

Soirée® - Besties collection

Discover the new and exquisite *Catharanthus roseus* hybrids — Soirée®. These versatile plants are not only beautiful but also perfect for mixing with other varieties and colours. Their charm and sweetness are irresistible to both growers and consumers, making them the perfect addition to any collection.

With their invaluable attractiveness for retailers and garden centres, Soirée® will be the new star of sales tables. These little wonders are exclusively grown from cuttings so they are extremely resistant and future-proof. Perfect for those who are just starting their gardening journey and want a low-maintenance flowery friend. At the moment available in five shades, from bright white to poppy and glowy cerise.

Soirée® White is compact, bright and sturdy; Soirée® Hot Pink is sparkling and compact; Soirée® Pink White Eye has very strong branching; Soirée® Cerise White Eye is extra rich in flowers; Soirée® Light Pink Dark Eye is the most delicate colour of the line and a real eye-catcher. All of them are suitable for small pots (seven centimetre) , T Soirée® collection is the perfect companion for container gardening and they can light up even the tiniest of spaces. Looking at all of them in a row is like stepping into a colourful and sweet candy shop, you will be attracted by their cuteness.

PERLIGRAN® Hydro – the ideal water storage medium

PERLIGRAN® Hydro enriches any horticultural substrate. Peat-free and peat-reduced substrates in particular benefit from the amazing water storage

capacity of natural volcanic rock. The extremely fine, porous structure of this special granulate has a particularly large number of water-conducting pores

and is therefore able to absorb an exceptionally high volume of water and release it to the plant as required.

▮ Special granulate for use in substrates: provides more water to the plant via the high number of water-bearing pores

▮ Highly suitable for light soils with low water-bearing capacity and peat-free or peat-reduced substrates

▮ As a substrate supplement for all types of application (potting soil for consumers and professional substrates)

▮ For flower beds and balconies

▮ For plants with large water requirements

CST 150 LP - stretch wrapper with flat turntable

The CST 150 is a turntable stretch wrapper. The machine is ergonomically very suitable as a substitute for manual wrapping, which is often heavy and strenuous.

The CST 150 has a turntable with 1650 millimetre diameter and is equipped with a photocell that automatically detects the height of the load. A motorized system a pre-stretch up to 250 per cent. Therefore reducing the amount of film used per wrapped pallet and this allows you to save on costs and contribute to a sustainable production line.

The user friendly control panel allows you to store up to 32 wrapping programs to apply different wrapping methods quickly. The machine makes use of six working methods: up and down, wrapping with top-sheet, only up, only down, in layers and by stacking. The stretch wrapper can be used semi-manual, semi-automatic and with a fixed height.

The CST 150 can wrap all types of pallets with its many features.

Benefits

- | Many features
- | User-friendly and ergonomic control panel
- | 32 wrapping programs
- | Film saving due to high pre-stretch

Options

- | Bigger turntable 1800 millimetre
- | Ramp (for pallet jack or forklift)
- | Maximum load of 2000 kilogram
- | Maximum wrapping height of 3000 millimetre
- | Top-press
- | Photocell for dark loads
- | Anti-static system

| Other options on request

Revolutionary biobased and biodegradable stake that feeds the plant

Voodstoc introduces a plant label display stake that feeds the plant. In collaboration with the University of Wageningen and Rodenburg Biopolymers they developed this particular stake. During a period of ten weeks it gradually releases the food to the plant.

Voodstoc is not only bio based, but also biodegradable. It fits perfectly in the new way of thinking about the circular economy. Offering a sustainable alternative for fossil fuels, the company uses starch obtained from waste from the potato industry. The raw material for Voodstoc is already in the circular production circle. An excellent alternative to the wooden stakes, which deprives new wood to nature.

CLIMAVI Soil

The CLIMAVI SOIL is a completely newly developed soil sensor for precise monitoring of soil moisture and the plant microclimate. It records key parameters such as soil temperature, soil moisture and permittivity in a substrate volume - at three measuring depths (15 x 5 centimetre volume each) with just one device. Thanks to its flexible interfaces, it can be easily connected to SDI-12-based IoT nodes such as the CLIMAVI One (optionally also via UART or Modbus).

Calibration can either be performed manually or automated via the CLIMAVI software. This offers comprehensive tools for mapping soil parameters, calculating volumetric water content and creating threshold-based alarms for irrigation, disease protection or frost warnings. Installation is quick and easy with the specially developed installation tool that is provided.

Functions:

- | SDI-12 / RS485 (Modbus RTU)
- | Monitoring of soil temperature, moisture and permittivity of any substrate
- | First-time measurement of a homogeneous field in a large volume range without temperature dependence (patented)

Features:

- | Housing: Outdoor-compatible PC (Makrolon®), fully encapsulated electronics
- | Easy to install, calibrate and operate
- | Three variable measuring depths:
 - | Soil moisture (+/- 5 per cent VWC)
 - | Soil temperature (+/- 0.5 degree)
- | SDI-12 / RS232 / RS485 interface
- | Various awards and certifications

Fine dust filter NGFL

The fine dust filter NGFL is offered in a compact and modular design. The filter is available for automatically fed, powerful wood firing systems. This fine dust filter works with microporous ceramic filter elements for highest separating performance of up to 99,99 per cent. This means in practice often dust content less than 1 mg/Nm³ of flue gas, so it's hardly traceable.

The functioning in principle is easy: The hot gas is drawn from the outside to the inside through the filter elements, in this procedure dust particles are deposited on the outer surface of the ceramic elements. The automatic, time or difference pressure controlled cleaning of the filter elements is made by compressed air. An automatic, de-ashing in function of the ash quantity is made by ash screws or pushing ram into mobile ash collecting containers beside according to the customer's desire.

Advantages:

- | residual dust quantity
- | no cyclone pre-separator needed
- | ceramic filter elements temperature-resistant up to more than 1000 degree and completely insensitive towards burning and flying sparks
- | automatic time and difference pressure controlled cleaning of the filter elements by compressed air
- | automatic ash removal depending on ash quantity by ash screws or pushing ram into ash containers placed besides
- | retrofittable
- | compact, modular design
- | meets the requirements of all currently valid eligibility programs
- | also suitable for fuel of the fuel groups 6 and 7 (according to 1. BImSchV)
- | remote maintenance optional

The garden roses collection: "Le profumatissime della riviera dei fiori®"

"Le profumatissime della riviera dei fiori®" collection of the best and most fragrant large flowered bush garden rose varieties, with exceptional colours, re-blooming, disease-resistant, worldwide awarded, with an amazing packaging, studied for garden centres.

Very fragrant: Each variety has a different, intense scent. Classic rose, fresh and flowery notes, or fruity notes: peach, apricot, pear, strawberry, red fruits, exotic fruits. Intense citrus notes: lemon, bergamot and grapefruit.

Wide range of colours: From the most delicate to the brightest, from the most classic colours to the most 'trendy'. Pure colours, two-tone and mottled varieties.

Reblooming: Generous bloomings from spring to frost.

Resistance: Thanks to its dark green and 'varnished' foliage, they are particularly resistant to diseases.

Double use: In the garden in small or large beds, on the balcony in large pots. At home: beautiful, fragrant, longlasting bouquets.

Worldwide awarded: The varieties of this collection won more than 100 prizes for their beauty and fragrance at main international new rose competitions such as Bagatelle, Lyon, Orleans, Nantes, Saverne, Den Haag (The Hague), Baden-Baden, Nyon, Rome, Le Roeulx, H. Kralove, Glasgow, Madrid, Barcelona and many others.

Amazing packaging: NIRP studied a specific marketing concept that accompanies the product in every aspect. The roses are ready to be displayed in a garden centre with a super attractive "dress" and many appealing accessories: the vase - blue as the sea, the banner, the poster, the gift brochures, the gift cards, the picture labels.

The coordinated image: All the accessories recall the coordinated image, a unique atmosphere.

BionicBack Exoskeleton

The BionicBack Exoskeleton is the ideal solution for professionals in landscaping and horticulture who want to reduce physical strain. This advanced, wearable support system is specifically designed to relieve the back and joints during physically demanding tasks and promote long-term health.

Product features

Ergonomic Support: Encourages correct posture and reduces spinal strain during bent-over tasks or when lifting heavy loads.

Lightweight and Comfortable: Weighing only 1.2 kilogram, the BionicBack offers an optimal balance of stability and freedom of movement without restricting mobility.

Adjustable Fit: Customizable to suit different body sizes and shapes, ensuring a high level of wearing comfort.

Durable and Robust: Made from high-quality materials, the BionicBack withstands the harsh conditions of outdoor environments.

Easy to Use: Its intuitive design allows for quick and simple donning and doffing within seconds.

Relief values

Scientific studies show that the BionicBack reduces strain by up to 30% and muscle fatigue by up to 86 per cent. This helps users stay fit and productive for longer. The exoskeleton also promotes ergonomic work practices by supporting natural movements and improving posture, enhancing workplace safety and health.

Applications

The BionicBack is highly versatile: whether planting trees, laying paving stones, transporting materials, or soil preparation, it supports workers in performing tasks more efficiently and healthily. This boosts productivity and employee satisfaction.

New organic FlecoGro range and the soil activator Gronamic 6-2-4

FlecoGro® comprises two new, granulated organic NPK fertilizers for horticulture, landscaping and fruit and vegetable production.

FlecoGro® Plus also contains a complete trace package based on Micromax Premium. Selected and origin-tested raw materials of agricultural and animal origin are used in the production process. Both FlecoGro® formulations are listed in the FiBL list for organic production in Germany. They impress with their long-term effect and low-dust granulation for easy handling.

Gronamic soil activator 6-2-4

The dust-free minigranulated Gronamic 6-2-4 combines fertilizer and soil activation. In addition to nutrients from polyhalite, it supplies recycled phosphorus from struvite granules and the proven plant-strengthening seaweed extract SMX based on the algae *Ascophyllum nodosum*.

Gronamic 6-2-4 is available in 20 kilogram bags. It is recommended for use on golf greens, tees, fairways, sports fields and in landscaping or as an organic-mineral all-round fertilizer for beds, trees and shrubs. The recommended application rate for lawns is 30-50 g/m².

Solar Intelligent Hybrid Lighting

Luxform Intelligent Hybrid Solar lamps are standard equipped with an intelligent energy management. By using Hybrid technology, the best of both worlds is brought together. The energy-efficiency of solar and the certainty of light all year round.

All lamps of Luxform Intelligent Hybrid solar series are equipped with a self-thinking system, which distributes the stored energy evenly over eight burning hours. During the winter months you can set the lamp to 50 per cent of the light output/brightness, so that the lamp has enough energy to illuminate the garden in the winter months.

Is the lamp in a shaded spot or is it dark and bad weather for several days in a row? Then you can give the lamp a boost by charging it yourself with the supplied USB cable. This guarantees consistent light output. This means that different charging options can be used effortlessly, so that maximum efficiency is guaranteed. The brightness may decrease when the battery is not fully charged.

OxyBull

The OxyBull is an advanced aeration system that uses microbubble technology. The system ensures a saturated acid content of 120 per cent. Microbubbles are fractionally larger than nanobubbles, which causes movement in the water storage. These movements effectively combat the growth of organic pollution and algae. The OxyBull can be properly monitored when it is connected to the Agrona oxygen meter.

It is essential for every grower to get the most out of the crop. Microbubble technology helps by increasing the number of available oxygen atoms and increasing the absorption of nutrients. If roots are low on oxygen, they have no choice but to replace it with other compounds.

The substance ethylene is then created. This causes cell damage and increases the risk of various types of infections. Temperature is the main variable that affects the amount of molecular oxygen the water can hold. The higher the water temperature, the lower the amount of dissolved oxygen that the water can hold. This is why aerobic bacteria are able to multiply effectively at higher temperatures, which will result in a stronger and more vital crop. This aeration system for horticulture has been further developed in recent years. This has resulted in a product that both introduces a lot of oxygen with a high homogeneous distribution and has a long lifespan.

COIR PITH - a growing media for Agri/Horticulture Applications

Coir pith, the by-product of dehusking of coconut fibre, is the spongy material that binds the coconut fibre in the coconut husk. As an excellent soil conditioner, it now finds varied uses as a good manure and in horticultural applications as a soil-less growing medium. Coir pith is a substitute for peat moss which is widely in use in European countries and is made available in various forms like organic manure, grow bags, briquettes, discs and more of different sizes.

Let's get glossy - highgloss for every room

The new Glossy collection from LECHUZA brings a hint of glamour to the living room. The planters with high-quality varnished surfaces give rooms an elegant feel. The trendsetting pieces do not only look sophisticated, but also impress with their integrated irrigation system, giving plants access to a reliable water supply. The new Glossy planters are the must-haves of the season.

Following a high-gloss makeover, the popular LECHUZA planter CUBE now comes in three additional brilliant high-gloss shades. The high-gloss surface forms a modern contrast to green houseplants or delicate flowers, making CUBE Glossy a real eye-catcher. The larger CUBE Glossy Triple offers a lot of space for flowers, herbs or smaller shrubs and serves as a sophisticated highlight that will give any living space a glossy feel. With its elongated shape, the new planter can be an impressive herb garden on the windowsill, a garden for succulents on the living room shelf or an unusual flowering decoration on the table.

With the Green Wall Home Kit Glossy by LECHUZA, a well maintained, hanging garden that gives a new perspective on green and flowering plants can be created in no time at all. If you don't have much space or simply enjoy unusual plant designs, you can now bring a touch of nature to your very own wall. As classic wall greenery, as creative holders for make-up tools in the bathroom or as pencil box in the children's bedroom – the Green Wall Home Kit Glossy is a true all-rounder and highly versatile.

To make sure that caring for your plants doesn't get too stressful, the LECHUZA irrigation system will look after the water supply for your green flatmates. The plants can be placed in the planter in their pots, eliminating the need for time-consuming repotting. A wick, which is placed in the pot from below, transports moisture to the roots. This is how easy it can be to take care of your plants.

ReduSol

ReduSol is a shading agent that reflects high levels of solar energy. It is wear-resistant and can be easily removed with ReduClean. For many years ReduSol is the obvious choice for protecting crops against excess heat and light.

Every shading agent has its strong features. The agent that best suits your situation mainly depends on the crop and sometimes the variety. ReduSol provides shade from the sunlight across the whole spectrum. Depending on the climate, both light-preferring and shade-preferring crops can benefit from ReduSol.

Xanthoceras sorbifolium, the butter nut tree or yellow horn

Xanthoceras sorbifolium, the butter nut tree or yellow horn: This shrub, native to northern China, fulfils many of today's desired requirements for an uncomplicated, useful, climate-friendly woody plant.

With its mature of two to four metres, it prefers well-drained to lean soils in both small gardens and large parks. It is considered to be extremely drought-resistant. The racemose inflorescences, which appear from April to June and range in colour from yellowish white to carmine red, are wonderfully fragrant and provide bees and bumblebees with an abundant source of food. In autumn, chestnut-like capsule fruits form, which are edible raw or cooked with a nutty flavour. The long, feathery leaves also have a high ornamental value.

Xanthoceras is sold with a hand-drawn, noble colour label, which underlines the value of this still rare woody plant.

Malus 'Royal Raindrops®' exclusive by Ley

Eye-popping magenta pink blooms, deep purple cutleaf foliage, sparkling red fruits and bright fall color give all-season appeal to this easy-care flowering ornamental. Superior disease resistance, adaptability, plus heat and drought tolerance make this unique crabapple a crown jewel among trees.

Refined, uniquely shaped leaves emerge glossy deep purple and maintain their rich color through the heat of summer. Fall color is a madly of bronze, orange and purple. Tiny persistent, bright red fruits appearing in late summer are prized by wildlife and add winter interest. Strong branch angles and upright growth habit minimize the pruning and shaping needed to develop a balanced canopy. More vigorous than other purple-leaved cultivars, 'Royal Raindrops®' Crabapple quickly gains caliper while developing a sturdy, well-tapered trunk.

Coco Substrate (Coco Peat)

Kokosflora coco substrates are soil enhancers which are mixed with peat moss to enhance soil characteristics such as drainage, aeration and water holding capacity to promote better root growth in horticultural applications.

Kokosflora coco substrates are also a preferred medium in soilless cultivation directly as it can be used for many cultivation cycles over several years before replacing. Coco substrates are collected as by-product out of coir fiber extraction from dried coconut husks. Hence it is an environment friendly 100 per cent natural growing medium from renewable coconut plantation with no deforestation. Kokosflora coco substrates are triple washed to remove excessive water soluble salts and other impurities to bring the electrolyte contents within the range.

Cocopeat

Cocopeat is a byproduct of coconut fibre and is in high demand among garden centres and horticulture nurseries. This is used as a growing medium which provides faster germination and quicker seeding rotations, increases air porosity, retains water and helps with irrigation.

Properties of Cocopeat:

- | Cocopeat is light, easy to handle and can even be reused for up to four years. The physical and biochemical properties of cocopeat make it resistant to bacterial and fungal growth.
- | Cocopeat disintegrates slowly. It only begins to break down when it is ten years old, thus providing long-term benefits.
- | It has pH of 5.2 to 6.8 which is neutral to slightly acidic. This makes it great to be mixed with alkaline garden soil.
- | Cocopeat can store and release nutrients to plants for extended periods of time.
- | It has great oxygenation properties which are important for healthy root development.
- | Cocopeat can be combined with any of the usual ingredients like soil and manure to be used as a mixture or a stand-alone product.
- | Cocopeat is available at affordable price for a quality product with an environmentally sustainable future.
- | Cocopeat is a perfect soil conditioner, and it can retain moisture up to eight times of its volume. It is entirely organic.
- | Cocopeat is consistent and uniform in texture, and easy to handle. Unlike soil, it does not form any mud.

Where to use cocopeat?

Cocopeat is a fantastic sowing medium. It is used to sow the seeds of vegetables and seasonal flowers in seedling trays. Further more it is a perfect rooting medium. Stem cuttings are inserted in the cocopeat for root induction.

Cocopeat is very good for soilless gardening and hydroponic farming. It is an essential ingredient of various potting media like pot-o-mix and organic veggie-mix.

Potting mixture with added cocopeat is suitable for indoor plants, cacti and succulents, dish gardens, terrariums and hanging baskets.

Vertical Gardens - Roof Gardens

Vertigan presents a range of innovative developments in vertical gardens - "Indoor" at home, in the working place, in the office. Can be combined with hydroponic system and "Outdoor" to cover concrete walls, house facades, fences, concrete pillars, bridges and public buildings.

All products are equipped with automatic irrigation systems.

For roof gardens Vertigan has developed a smart system to cover the roof in a green garden where you can grow flowers, grass, green vegetation, organic vegetables and even ornamental trees or fruits.

The system allows to make any flat roof of the parking lots or any unused flat roof into a beautiful garden. All with a do-it-yourself system and like the vertical gardens, equipped with automatic irrigation systems.

All systems have no direct contact with the building walls or floors, so no moss is formed, which harms the building.

Vertical landscaping and roofs gardens add an additional layer of thermal insulation to existing insulation systems.

The innovations focus on very easy assembly, easy maintenance, water saving, fertilizer savings, and ultimately very important, low prices. All products can be set without professional help.

Thanks to the modular system, you can start with a small base unit and expand it to a very big magnificent garden. All extension units matched together as Lego game bricks.

Another development is "mobile vertical gardens". They serve as mobile green partitions in banquet halls, hotel lobbies, wedding festive events background, fairs and exhibition pavillons.

All facilities are decorated with live plants and equipped with automatic irrigation. Replacing the plants to change the design takes only a few minutes. The systems are equipped with quiet and hidden wheels so they can be moved easily.

Using a production management app to grow smarter

The new digital feature from Ellepot connects their integrated propagation system to the Ellepot Live app (available for IOS and Android). The intuitive app is designed to make production planning easier.

The app translates machine data into easily understood visuals, assisting production managers in calculating and ordering production materials and keeping track of daily goals, and it also assists machine operators in performing maintenance tasks, ordering certified Ellepot spare parts, and contacting the Ellepot Service Team.

“Everything you need to track and plan out on a day-to-day basis is there on the app, but there is actually also an Ellepot Live web solution that allows managers further production insights like statistics and other details. It was just important for us to create a tool that was very convenient, and we all know that most people have smartphones nowadays, and that is why we say that Ellepot Live is something you have right at your fingertips, it simply couldn't be any more convenient,” says Ellepot CEO, Lars Steen Pedersen.

Coconut Fiber Pot

Coir pots are biodegradable containers made from coconut coir fibers, offering a sustainable alternative to plastic and peat-based pots.

Key Features:

pH Neutral: Ideal for various plants as it does not alter soil pH.

Antimicrobial Properties: Prevents mold and diseases, creating a safer environment for plants.

Aeration: Promotes healthy root growth and reduces the risk of root rot.

Moisture Retention: Keeps soil consistently moist, perfect for plants requiring regular hydration.

Biodegradable: Naturally decomposes, enriching the soil as it breaks down.

Comparison with other materials:

Plastic Pots: Coir is biodegradable and offers better aeration, reducing the risk of root rot.

Peat Pots: Coir is more sustainable and retains moisture better.

Soil-based Pots: Lighter and more porous, coir provides better drainage and root health.

Case Erector

Square cases are the key to successful secondary packaging. Lantech Case Erectors are the key to square cases.

Square cases pack better, stack better, and protect better. They provide the structural integrity to deliver the performance their designer intended. Fact: cases lose 30 per cent of their stacking strength if their sides are not aligned. There are barriers to erecting square cases. Thinner corrugated, temperature and humidity changes, and variations in case blanks can cause cases to be "unsquared" or lead to machine jams.

Lantech Case Erectors overcome these barriers through precise case management and 100 per cent control of cases throughout the entire erecting process, ensuring your cases perform as designed and are produced with maximum efficiency.

Business ERP Software

Advanced planning is the key to staying competitive, and Mprise Agriware delivers the tools to make it happen. With cutting-edge features for greenhouse inventory and supply chain management, it empowers growers to plan smarter and execute better.

Real-time inventory tracking ensures you always know what's in stock, preventing costly overstocking or shortages. Paired with advanced planning capabilities, you can align production schedules with customer demand and supplier timelines, minimizing waste and maximizing efficiency. From materials procurement to order fulfillment, Agriware keeps your operations synchronized and scalable.

Supply chain optimization is seamlessly integrated, allowing you to forecast needs, plan for peak seasons, and streamline logistics. By connecting inventory, production, and supplier data in one system, Agriware ensures decisions are data-driven and timely, helping you stay ahead in an increasingly connected market.

Built on Microsoft Dynamics 365 Business Central, Agriware provides a powerful and flexible platform tailored for the horticulture industry. These innovations highlight Mprise Agriware's commitment to solving real challenges growers face, enabling them to focus on what matters most - producing high-quality crops.

Advanced planning isn't just a feature; it's the foundation for future-proof greenhouse management.

Sundaville® Flamingo Pink

The Sundaville® Flamingo Pink is new on the market since 2021. The plant has special pink coloured flowers and flowers optimally until the first frost. Sundaville® is a very grateful plant and requires almost no care.

This variety is (almost) nowhere else available. The Flamingo Pink is unique because of the beautiful drawing on the flower. The edges of the flower are flamed light pink. It resembles the feathers of a flamingo, which is also why this species gets its name. Furthermore, the flower has dark pink speckles.

Protective cover "Daily.heavy 2023"

Under the motto "time for change", the new entry-level model of the proven protective covers for CC containers will be presented. It combines many well thought-out and already proven details with a new and variable closure and thus convinces with even easier handling. The protective cover can also be equipped with special protectors, which reduce wear and tear and thus increase the service life and thus also the cost-effectiveness of the protective covers many times over.

Furthermore, this model is also available in a particularly sustainable version, made from marine plastic, among other materials. In addition, the modular design enables the tool-free replacement of classic wear parts such as hooks, loops or tensioning rubbers. From the middle of 2023, the company will also be offering a repair service at a fixed price for the first time.

Of course, each protective cover can also be customised with a logo on request and there is even a solution for special formats.

pulsFOG Cold fogger Turbo ULV

The Turbo ULV is a portable AC powered pneumatic cold fogger. Its high performance turbine creates a powerful air stream of up to 50 l/s.

The active solution is atomised into a fine aerosol, which is adjustable from approximately ten to 100 µm depending on the flow rate setting. The precise flow regulation is provided by means of interchangeable nozzles. Chemical resistant materials assure long life and high performance for professional fogging jobs.

- Trouble free and simple operation
- High mobility due to small dimensions, low weight and extended fogging tube
- Detachable solution tank for easy filling and cleaning
- Allows space spray and/or residual applications
- High efficiency air filter protects the motor and internal components
- Sturdy construction for professional use

Technical Data:

Packing dimensions : 59 x 35 x 37 centimetre

Weight : 6,6 kilogram net, 8,3 kilogram gross

Capacity of solution tank : nominal 5 Liter

Power supply: 230 V AC / 50-60 Hz or 110 V AC / 50-60 Hz

Electrical power rating: 1,2 kW

Effective fog throwing range: Up to 25 m

Droplet size dependent on nozzle size used: ten to 100 µm

Climate Gardeners - the climate proof plants mix for innovative garden center in Europe

With inspirations from the wild, it is possible to create low-maintenance plantings for a high range of diversity in the garden. Plantings which don't require a lot of irrigation, but do bring a cooling and decorative value with blooming throughout the seasons and nice winter features. Plantings which are important to biodiversity and whom can survive future extremities of climate change and even benefit from it.

The idea behind these arrangements is to easily increase the green space within gardens by creating a personal landscape design package with climate adaptive solutions by introducing a simple planting concept for low maintenance. The concept for these arrangements is to give people a simple method to broaden their greenery in the garden with a miniature landscape design effect.

Rijnbeek Perennials want to create a bridge between creative and inspiring landscape design directly with the private gardens.

All the plants are grown in 100 per cent peat-free mix and chosen with the utmost care. Surprise your customers with a unique assortment and based on a rotating method the company will deliver new and interesting mixtures every month.

Very smart: Artificial Intelligence in horticulture

As a new module in the **g-pda.®** family, JayVee Green Consult Jens Varnskühler presents the new **g-pda.®PlantDoctor**: using AI (Artificial Intelligence) and ML (Machine Learning) to increase your efficiency the smart way.

When checking your cultures just take a photo of a symptomatic leaf or a pest with your smartphone and the **g-pda.®PlantDoctor** immediately tells you which disease it is. Now scan the QR code of the affected stock and the **g-pda.®PlantDoctor** will suggest a treatment. In doing so, the already applied agents, incompatibilities and legal regulations are automatically taken into account.

In the next step, **g-pda.®PlantDoctor** checks the current inventory of the selected agent, calculates the area to be treated, the tank recipe and creates a task that you can assign directly to an employee.

A true flower bomb: ViV® Olivia - Helleborus x Ericsmithii

ViV® Olivia, a distinctive Hellebore variety, offering a unique combination of long-lasting flowering, seasonal colour variation and environmental consciousness - making it a charming and enduring choice for plant enthusiasts.

Undergoing a captivating colour transformation from pink buds to creamy-white flowers and dark pink flowers, ViV® Olivia adds visual appeal month after month. Thanks to the beautiful plant build-up and huge amount of flowers, ViV® Olivia is called "the flower bomb".

Beyond aesthetics, it is a sustainable choice, attracting bees as an early pollinator.

She flourishes in various applications; in pots (15 to 17 litre) on outdoor terraces and in semi-shade garden spots. She boasts an impressive shelf life with a five-month blossoming period. ViV® Olivia is well-suited for easy gardening even in freezing temperatures. Tested for disease resistance, it emerges as a perennial favourite year after year.

Mangave Praying Hands surprises with a completely different look

If there's one family that continually surprises, it's the Mad about Mangave® family. Mangave Praying Hands surprises everyone with a completely different look than any other Mangave. Thanks to the unique growth habit of one of its parents, Agave ocahui, the dark green foliage grows up: you could almost mistake it for an elegant teardrop.

The varieties of Mad about Mangave® are fast growers. Plant Mangave in well-drained soil and when they reach the desired size, water sparingly. Mangave loves a spot in full sun; this is where the colours and distinctive spots show best. Being a true sun worshipper, Praying Hands is the perfect addition to the exotic terrace. Its colourful and striking foliage makes it perfect as a specimen in a pot or container, but just as great for a mixed container with other succulents.

Praying Hands has a very compact habit and grows up to 25 centimetre high and wide. This super succulent is drought tolerant and can handle some neglect. You hardly have to worry about it. A unique, sturdy succulent that steals the show indoors and outdoors. Protect it from frost and wet feet, and you'll be friends for life. Hardy to minus five degrees.

Picea Magical Christmas

Picea Magical Christmas is a fast-growing mini Christmas tree. This successor to Magical Santa is easy to decorate due to its sturdy branches, with minimal risk of breakage.

Like Magical Santa, Magical Christmas grows quickly, significantly reducing the cultivation period. The needles of Magical Christmas curl elegantly around the branch, making this little tree extra decorative.

The spruce can be kept indoors during the Christmas season and afterward placed in the garden or on the terrace, where it will grow into a compact, well-shaped tree up to 150 centimeter tall.

Hoverflies *Episyrphus balteatus* and *Sphaerophoria rueppellii*

New to the SAUTTER & STEPPER GmbH choice of products are two native hoverflies as natural predators of aphids. In the cold season, the *Episyrphus balteatus* are active from five to 25 degree, while the *Sphaerophoria rueppellii* are successful at summer temperatures from twelve up to 40 degree.

They spread almost by themselves (when using pupae), are suitable as a quick help against a pest infestation (used as larvae) and support pollination. If there is a supply of suitable flowers, they can even be established. In addition to aphids, they can also feed on other pests such as whiteflies or spider mites.

Some customers made already very good experiences with them during the test phase at SAUTTER & STEPPER. Due to the existing climate changes, such beneficial organisms are suitable for extreme temperatures and are an excellent addition to the existing program. The pupae are delivered in practical little boxes, which are hung directly into the plants centrally in the greenhouse.

Eco Grow Tex biodegradable mulch film

The biodegradable mulch film can be used for organic farming and hobby farming. The mulch film can be delivered in many different sizes and qualities, all depending on the type of crop that is going to be cultivated. The soil biodegradable mulch film can also be comprised into different types of aromas, fertilisers, or seeds to improve growth.

Sustainable agriculture

Tried and tested in everyday farm work: By using TURFquick's certified compostable mulch films, based on the equally compostable cellulose TOD®, farmers gain multiple advantages. The TOD® mulch films don't need to be disposed, but can be ploughed into the soil, where they get naturally decomposed by microorganisms. By this farmers do not only protect the environment by practicing a sustainable agriculture, but they also save themselves a lot of work, time and money.

Advantages for farmers

- | Increase soil temperature
- | Speed up the germination and cultivation cycles
- | Long-term nutritious soil
- | Cost and labour efficient
- | Eliminate or reduce the use of herbicides and pesticides
- | Reduce water consumption
- | Keep fertilizers and nutrients closer to the plant

Urban Gardening

Urbanization is increasing due to higher living standards in cities leading to housing shortages, lack of space and less free time. People who live in cities increasingly want to have nature closer to home which has in itself created a new trend - The Urban Garden. A consequence of this is that people want to organize their scarce free time with as higher quality as possible.

> Patio Collection: the patio collection contains the most popular varieties from around the world allowing you to create amazing flowering pots and beautiful borders.

> Lasagne Planting: Lasagne planting of flower bulbs makes it possible to enjoy long lasting colourful flowers early. The idea is to fill pots or bins with 1-2-3 layers of different flower bulbs. This way the consumer can enjoy the beauty of the flowers on their patio or balcony.

> Dig, Drop, Done: The pre-planted flower bulb tray is a garden innovation at its best. Crunched for time? Do not have a green thumb? These flower bulbs are ready to plant. The consumer does not need to plan out the garden. In three easy steps they can dig a hole, drop the tray or container in the garden and wait for spring, all without dirty hands.

Ready-to-use dwarf bamboo sod, resistant to extreme temperatures in both full shade and full sun.

Easy-to-install evergreen perennial groundcover grass, ideal for greening cemented and/or degraded areas, able to consolidate the ground and prevent soil erosion with significant CO2 absorption capabilities.

KonsolidOM requires no maintenance, can coexist with any other plant and does not produce pollen or seeds. Its rhizomatous apparatus is well-developed and its green and vigorous leaf system gives a great immediate aesthetic effect.

Hybrid lighting solution for professional greenhouses

BLV is one of the very few providers in the market that offers a complete range of assimilation lighting: From lamps and power supplies to complete luminaires and from HPS or MH to LED, all from one source and perfectly synchronised with each other.

BLV introduces a hybrid solution: the well established, efficient and reliable HPS lights in combination with high performance LED interlighting. This hybrid solution is designed for greenhouses with high wire crops that aim for the best standards.

The HPS luminaires are equipped with a lamp and power supply produced in BLV's factories in Europe. The compact and solid design provides best-in-class PAR values and spectra for optimum plant growth. Safety, reliability, efficiency and durability are guaranteed. The open reflector allows an easy heat dissipation that increases the lifetime of the lamp. This can be translated directly into a reduction of maintenance and replacement costs.

The LED interlighting luminaires are available in different spectra, adapted to the needs of your crop! The passively cooled luminaire has been designed to optimise efficiency, light homogeneity and light absorption by the plants. The anodised aluminium housing is non-corrosive and classified with an ingress protection of IP66. Installation in a continuous line along the rows of plants is made easy thanks to feed-through wiring.

FYRE - Cachepot with rollers

Elegant and sustainable, Fyre is the new cache pot made from recycled plastic, ensuring a reduced environmental impact without renouncing style.

A minimalist design gives it a modern and distinctive touch, ideal for furnishing any environment, both indoors and outdoors.

Fyre features a striped texture and is available in both warm shades such as Mango and Brick, or in cooler tones such as Rust and Anthracite.

The discrete yet functional integrated wheels allow it to be moved easily and effortlessly, even with large plants.

The ribbed surface and smart design make it unique and refined. The perfect cache pot if you're looking for practicality and design in one product.

Universal data acquisition system

IoT4H2O® (pronounced "IoT for water") are small, low-cost data acquisition and transmission devices that radio over the LoraWAN or NB IoT radio standards. The devices can be equipped with a variety of different sensors: Watermarks, various temperature sensors, electronic tensiometers, volumetric soil water content sensors from numerous manufacturers, and combination temperature and rel. humidity sensors. Additional sensors are continuously being integrated into the IoT4H2O® system.

This makes devices available for cultivation with which climate and soil moisture can be comprehensively monitored both in the tunnel or greenhouse and in the field. In addition, there is a special version for recording the temperature in the asparagus comb at four depths.

Precise knowledge of key parameters in cultivation enables natural resources to be used sparingly and responsibly. In addition, the system is designed in such a way that existing, used sensors can also be reused. In this way, the investment costs for operation are reduced and resources are saved in the production of the sensors.

The measured values are displayed in the data clouds www.iot4water.de and www.spargeltemperatur.de and are available via web app for computers and smartphones. IoT4H2O® is being developed with support from the BMBF.

Entomatic™

Offering fast and even distribution of beneficials in a wide range of glasshouse crops, Entomatic™ is the adaptable automatic dispenser to help you.

Entomatic™ helps you with:

- | Uniform distribution of mites and insects in your crop for improved biocontrol
- | Save labour
 - by applying beneficials in multiple rows or bigger surfaces in one go (two to 16 dispensing points)
 - by an easy-to-handle dispenser that can be operated by one person
- | Adaptation to your growing system. No pipe rail, no problem. Entomatic™ is also mountable on carts, tractors, or spraying equipment already present at your farm.

How it works

Entomatic™ is a simple modular machine which is highly adaptable and can be configured to suit almost all glasshouse crops- soft fruit, protected salads and ornamentals and any growing system. It has been designed to be easy to configure and intuitive to use.

Entomatic™ generates an airflow into which the insects or mites and their carrier are gently and homogenously introduced. The beneficials travel through the flexible tubes to the dispensing points (anywhere between two and 16) and are released onto the crop.

Hortiviv – Enriched substrates of the future

In the past few years there has been a large development for the selection of beneficial organism capable of enforcing plant growth. Through creating natural symbiosis with plant roots, several of these organisms have shown to improve the resilience of plants. Greenyard Horticulture developed an innovative technology to bring these benevolent microorganisms to life, so they have a direct action at the plant roots.

Hortiviv® is a substrate inoculated with fungi, directly settled in the substrate in their living form. For two consecutive years, the University of Ghent and ILVO (Flemish institute for agriculture) used this inoculated substrate to conduct experiments during strawberry cultivation. These experiments showed that strawberries grown on the inoculated Hortiviv® substrate are more resistant to decay and improving thus significantly the shelf-life.

In addition, Hortiviv® can also be used for root sensitive tree cultivations, where it also has the ability to stimulate the plant growth and root vigor. Hortiviv® is allowed on the Belgian market for use in substrates (Derogation EM736.E).

CHA represents Great Britain as the partner country of IPM ESSEN 2023

From 24 to 27 January 2023, the United Kingdom will be the official country partner of the world's leading trade fair for horticulture.

UK companies specialising in plants, technology and equipment will come to present themselves and their products on the British pavilion, which promises to be a valuable additional visitor draw for the participating exhibitors.

A host of special events is being arranged to celebrate the expertise and innovation of the UK commercial horticulture sector, including a reception featuring British food and drink, English and Scottish music, feature planting displays at the show entrances and a wealth of information about the UK's commercial horticulture sector from the CHA team on the UK pavilion.

The International Horticultural Forum at the exhibition will provide insights from UK experts into current developments in the green sector in Great Britain.

The Commercial Horticultural Association will be in charge of the preparations and activities surrounding the partner country appearance, supported by the British Department for International Trade (DIT) and the British Embassy.

The UK produces a wide range of horticultural products. Many new plants will be travelling to Essen: among them, Whetman Plants International is launching two compact, fragrant, bee-friendly and drought-tolerant Choisya at the show: Choisya x dewitteana 'Little Bee' PBR and Choisya x dewitteana 'Little Honey Bee' PBR. New compact clematis cultivars from the Raymond J Evison programme such as 'The Duchess of Cornwall Evipo118', 'TsukikoTM Evipo110', 'RaveITM Evipo122', 'IsseyTM Evipo081' and 'PoseidonTM Evipo113' will be shown by Guernsey Clematis Nursery. The exhibitor Fairweather's Nurseries from the English county of Hampshire specialises in growing Agapanthus. The assortment comprises more than 50 varieties and these will be presented at the exhibition.

In addition to plants, trade visitors can also expect innovations in the field of technology and equipment: from environmentally-friendly and growth-promoting reusable pots from Caledonian Trees to cost-effective LED lighting solutions especially for horticulture from INDO Lighting; from customisable labels, packaging and sales materials from PPC Labels to sustainably produced gardening supplies from Tyne Moulds & Machinery.

DOPA plant-based plant pot

The horticulture business: Millions of vegetables, herbs, flowers, plants, trees, bulbs and seeds are cultivated and transported every year. Mainly in plastic pots and plastic trays. Thanks to the products available via the Panics' DOPA brand, Plantics B.V. changed the status quo.

Grow, crack, plant

DOPA is a plant pot made of paper, treated with special resin, and developed by Plantics. This organic resin is made of 100 per cent natural and locally available raw materials. This ensures that the DOPA plant pot is biodegradable and therefore can be composted at home. In line with the unique grow-crack-plant principle, consumers can plant the entire product, plant plus pot, in the earth. The DOPA pot breaks down after a while and becomes one with the earth again. Nice and easy and zero waste. As a result, DOPA contributes to a sustainable environment and the circular economy.

DOPA is a unique Dutch innovation from Plantics.

High-turnover product range expansion with wine and sparkling wine

The demand for supplementary products in garden, agricultural and DIY stores is growing continuously. Concept stores create shopping experiences. At first glance, they may seem somewhat alien to the sector. At second glance, they often involve products with a high degree of indispensable lifestyle. Wines, sparkling wines, secco & Co. combined with chocolates, coffee or fine brandies in outstanding qualities pair shopping experiences and personal consumption with gift suggestions that show appreciation and cut a fine figure as a guarantee for repeat purchases.

At Schaad winery, visitors can immerse themselves in an extensive world of wines with a marketable, easy-to-sell and profitable price-performance ratio and receive individual inspiration for selection and placement in their environment.

Swing collection

As every year, Plastecnic presents new items in the range with new pots in new colours and additional sizes that make its lines and collections even richer. Each novelty contains a background concept, a leitmotif that becomes clearer and clearer.

Every pot, one life. A concept, an invitation, a wish. We dream of a world in which everyone, even when choosing a pot, looks for beauty, style, nature and sustainability. The products from Plastecnic, made with over 70 per cent recycled plastic, are the result of an innovative and modern vision. Because in the Plastecnic dictionary, pots are not containers, but pots are the home of our plants. They are furnishing accessories, tasteful objects and elements of beauty. Plastecnic pots are the concrete realization of a constant and continuous work that combines research, attention and respect in the name of nature.

The new shapes are characterized by original and natural lines that emphasize their simplicity. The Mood Line collection is expanded with the SWINGmood pots, containers with versatile and functional shapes, such as the "Conca" diameter 30 and 40 centimetre, the 30 and 40 centimetre square and the 30, 35 and 42 centimetre round pots with a conical shape. They are perfect for anyone who wants to decorate their ambiente with plants, both at home and in the garden. They are models that are beautiful to look at and innovative, starting with the texture, characterized by the right balance between shiny and opaque effects that vary depending on the refraction of light. The texture gives these pots a unique value and makes the product desirable and even iconic.

Also new is the SWING pot cover in sizes 11, 13 and 15 centimetre diameter, which is available in six colours. Ideal for orchids.

Insect Hotel Premium

The Insect Hotel Premium is the solution for communities, clubs and companies. With an insect hotel you support numerous useful and endangered insect species. At the same time, the product also offers space for self-portrayal, for example in the form of a logo or coat of arms. Show everyone that you are doing good, protecting the environment and promoting biodiversity.

With this product, Tevigo rely on high-quality and durable materials such as robinia and European oak wood, from which the body and the nesting posts are made.

The insect hotel premium is made in a sheltered workshop in Germany. In this way, Tevigo not only keep transport routes and the carbon footprint small, but also support an important social institution.

Coco Chips

Coco Chips - peat-free alternative to coarse white peat: Gramoflor is presenting its new, renewable raw material Coco Chips for the first time. This peat substitute is made from shredded coconut shells, a residual material from coconut processing. Coco Chips provide an excellent, coarse-grained structure for substrates. As a peat-free alternative to coarse white peat, they are characterized by their very good structural stability, which has even been proven to be superior.

Thanks to the natural fibre content, Coco Chips promote the air capacity of the substrate, which is essential for healthy root development, among other things. Especially in combination with the wood fibre variants LIGNOFIBRE®c coarse and LIGNOFIBRE®, they are the perfect addition for professional substrates from pot size 13.

Thanks to the water retention in the coarse pieces, Coco Chips support lasting moisture despite their coarse structure.

The new Grow&Go hanging basket with water reservoir

Grow&Go is an innovative water reservoir system incorporated in the plant pot, which keeps plants watered for a few days, depending on the weather.

How does Grow&Go work?

The plant is watered until water runs out of the overflow holes in the base. This indicates that the special reservoir at the bottom of the pot is completely full, and keeps the plant in top condition.

The new 32 centimetre Nora Grow&Go

2 litre water tank

8 litres of substrate

Added value

Grow&Go pots are identified by a special sticker, which is present on the Nora and Imca as standard. Desch offers you the option of designing your own custom label for a Grow&Go pot, giving your product added value.

Benefits

- | Less frequent watering thanks to the large water tank
- | The tank prevents drying out and water wastage
- | Also available in Recover® made from post-consumer recycled plastic

DCM Lawn Fertilizer Relaunch - Proven quality in a new design

CUXIN DCM has completely revized its lawn fertilizer range and made it even more attractive. The lawn fertilizers appear under the well-known DCM brand in a new, modern design. The company has taken the relaunch as an opportunity to sharpen and optimize the product positioning.

For example, the moss-stopping effect of the popular lawn fertilizer Mikro Plus with living microorganisms has been clearly emphasized. In addition, the product is offered in the ten kilogam and 20 kilogram pack sizes as a special offer pack with ten per cent free content.

A new addition to the range is the lawn fertilizer Mikro Robo, which is specially designed for areas that are mowed with a robotic mower or a mulching mower. The top seller Lawn Fertilizer Special and the 100 per cent organic Lawn Fertilizer Nature will be available in attractively priced nin kilogram and 18 kilogram pack sizes in future.

The lawn fertilizer Start-Express for sowing and establishing lawns is now available in five kilogram bags for the standard lawn size of 100 squaremetre.

Informative brand pillars and lawn information brochures as well as an attractive secondary placement are available to accompany the relaunch at the POS. By the way: CUXIN DCM is the brand of the century in the "special fertilizer" category.

PLA Sleeves

You see and hear it everywhere: horticulture also needs to become more sustainable. That is why Koen Pack has added some 100 per cent biodegradable sleeves to its standard range. These sleeves are made of a durable and naturally degradable material. They are printed with water-based ink which it is better for the environment.

What are the advantages of PLA (Poly Lactic Acid)?

This material is not made of fossile fuels, in contrast to traditional plastics. These sleeves are made from renewable sources like sugar cane and corn. Because these sleeves are biodegradable, they can be composted after use. The consumer can simply throw the sleeves into the green waste bin together with the leaves. It is 100 per cent industrially compostable.

The sweet temptation

Sweet cherries are not only a treat for the palate, they are also true nutritional wonders: they contain numerous vitamins, minerals and antioxidants that help to promote good health. Whether fresh from the tree, as part of desserts or in savory dishes - the possible uses are varied and creative. But as tempting as the small fruits may be, the greater the challenges for growing them in your own garden due to climatic changes, pests such as the cherry fruit fly or diseases. Here, fruit novelties with certain characteristics can be the solution to one problem or another.

Visitors will find information on advantageous fruit varieties at the Artevos stand in the form of three tempting sweet cherries: PAPILLON® 'Pilango'-s - the insensitive one, SWING® 'PISUE192'-s - the self-fertile one, 'FELICITA'-s - the large one. Here is a small foretaste:

PAPILLON® Pilango - the insensitive one

In contrast to other bicolour sweet cherries of the past, the Papillon® variety is hardly susceptible to bruising. The particularly crunchy and juicy fruits also have an excellent cherry aroma. They have a low space susceptibility and inclination to windfalls. Their long harvest window begins in cherry week five. The trees have quite strong but compact growth with very good branching. The wood and leaves are robust, making the variety ideal for the home garden.

Bioextruder for wood fiber production

The Promeco Bioextruder is a patented machine with a proven track record of over 25 years. The extrusion process exerts pressure and friction on the feedstock resulting in a temperature increase causing the steam explosion and the defibration of the wood: this changes the physical structure of the wood and the heat eliminates the bacteria.

The robustness and reliability of the machine allow the treatment of all kinds of woody feedstock.

The wood fiber from the Bioextruder is easy to use and doesn't need additional treatments. It has superb water and nutrient holding capacity, low salt content, neutral pH and mixes easily in growing media blends.

Internal transport solutions

Internal transport of plants and trees is more easy with the rack solution. The racks provides you with a double saving: avoiding blowing over and easy transport.

Pots, trays and tree containers are supported during the growth. By placing the plants in wire racks at the potting machine, you save on extra activities outside on the cultivation floor. By arranging the plants inside in the right distribution in racks, you can drive them to the cultivation floor without taking them in your hands again. The racks are easy to transport with the forklift, while the crop can remain in the rack.

Because every grower uses other formats or planting distances, van Schaik supply the rack in many sizes and designs.

New Trend: Miracle sprouts and Microgreens

You've probably heard of bean sprouts, and you've probably tasted some, as they're an integral part of Asian cuisine. However, their popularity has also been growing in recent years with the growing trend of healthy eating.

What about Microgreens? Microgreens, or young shoots, are essentially just another developmental stage of sprouts. It is best if you grow the shoots yourself at home in the [Mungo sprouting bowl](#). The bowl consists of three floors, which allow the germination of three different types of seeds at the same time. Then spread the seeds evenly into each layer, which you pour water over twice a day. In two to three days your seeds should sprout and in another two to three days small green leaves should start growing. You can consume them at any stage.

Two particularly heat-tolerant and sun-tolerant *Fargesia* breeding selections

As the climate changes, the range of plants must also be adapted to the new challenges. Wilfried Janßen (WELL BORN BAMBOO®), known for his exceptional *Fargesia* breeds, has more than succeeded in this with his two new varieties "Sunbird" and "Arabica".

Bamboo is able to store large amounts of CO₂ due to its highly branched root system and rapid growth. *Fargesia* have the special property of growing pachymorphically (clump-forming) and not forming root runners. They are therefore ideal for local gardens, terraces and balconies. Most *Fargesia* varieties prefer a partially shaded location and will curl their leaves in strong sunlight, drought and frost. However, "Sunbird" and "Arabica" are completely different.

Fargesia rufa "Sunbird" impresses with its upright growth, which is unusual for *Fargesia rufa*, and can be easily cultivated in a pot. As the name "Sunbird" suggests, this variety thrives very well in the sun and in particularly warm locations. In test plantings it made an excellent impression in full sunlight and temperatures around 40 degree. The large, strong green leaves do not curl up, even in particularly strong sunlight. At the same time, the new shoots delight with attractive bronze-coloured nuances.

Fargesia rufa "Arabica" (The Cinnamonbamboo) is a striking eye-catcher. Particularly strong-growing - upright - with strong stalks and new shoots that are reminiscent of cinnamon sticks due to their almost coffee-brown colour. A particularly decorative eye-catcher that also looks great in exposed and sunny locations. What is particularly noteworthy is the two varieties' pronounced pest and disease resistance.

Impatiens Beacon: high resistance to downy mildew

Pan American Seed introduces NEW 3-colour Beacon mixes named after well-known lighthouses in locations where Impatiens downy mildew has been a significant problem. These have been trialed and approved to grow well together and look vibrant in the shade, and they offer high resistance to the widely prevalent populations of *Plasmopara destructor*, the cause of Impatiens downy mildew. All three mixes are suitable for packs, pots, hanging baskets and in-ground beds.

Beacon Impatiens will continue to help “shine the light” on lesser-known diseases by supporting a different charitable organisation each year with a percentage of sales.

TROLLEY M2

The UNI-TROLL Trolley M2 is designed to carry two 600 x 400 millimetre ISO modular boxes or plastic crates per shelf level.

Underneath, two swivel and two fixed Ø125 millimetre castors ensure easy maneuverability, and the strong and durable 40 millimetre PUR tread ensures noise-reduced rolling. Eight post profiles and four post extenders can be placed safely in the trolley base frame. This protects the posts from being damaged and makes them easy to handle.

A Trolley M2 frame can also be placed on the top of the posts and you can take advantage of having a double-layer trolley load for the full truck height on long-distance transportations. Trolley base frames can be stacked on top of each other to reduce cost when empty trolleys are returned.

Measures and capacity

The Trolley M2 base frame is 891 x 616 millimetre and the height from ground level is 270 millimetre. The inside length is 815 millimetre.

Its unloaded weight with posts is 47 kilogram (base frame 25 and posts in total 22 kilogram). The trolley's carrying capacity is 400 kilogram SWL (Safe Working Load).

When stacked on top of each other, the stacking height of the first layer is 270 millimetre. When stored empty, twelve base frames can be stacked on top of each other to reach a height of 2580 millimetre.

Shelves

Trolley M2 shelves are available in three different variations:

The Shelf M2 PPGF is a plastic version that carries 40 kilogram UDL (Uniform Distributed Load) and is stackable to reduce the volume when returned empty. Its unloaded weight is 4.7 kilogram. The material is impact-resistant and in a new design with shock-absorbing high-tensile steel rods.

The Shelf M2 PWS is the plywood stackable shelf version, which can carry 60 kilogram UDL. Its unloaded weight is 3.9 kilogram.

The Shelf M2 PW is the plywood non-stackable shelf version, which can carry 60 kilogram UDL and is placed in the posts when returned empty. Its unloaded weight is 3.7 kilogram.

Clara-net, the diffuse light shade net

The shade net provides shade and cooling without compromising light transmission. Ideal for installations in direct contact with plastic films or within greenhouses. Specifically designed for herbaceous plants such as valerian, arugula, spinach, and lettuce, as well as nightshades like tomatoes, peppers, and eggplants.

Clara-net benefits:

- | Reduces temperature through infrared reflection (turns white when heated)
- | Diffuses light evenly, promoting optimal plant growth
- | Conserves water
- | Protects plants from sunburn caused by excessive radiation
- | Offers consistent shading performance unaffected by rain or aging, unlike lime-based coatings
- | Enables quick and easy installation and removal

Lucky Berry® Blackberry

Brand-new: The Lucky Berry® family has grown again. The blackberry now joins the 4-month blueberry, raspberry and strawberry. It convinces with sweet, deep black fruits and the productivity.

Due to the steadily ripening fruits, the berries can be harvested for four months from July to October. The healthy snack is absolutely in the snack trend. Thanks to its very compact growth and the ability to cut it, the Rubus is also perfect for the planter.

Like the other berries in the series, the Lucky Berry® blackberry is available in a bright 4.6-liter pot, this time in purple and with a 6-language label. The extremely positive nutritional information can be found on the label.

Of course, AVS will also be showing the tried and tested Lucky Berry blueberries, raspberries and strawberries.

Chrysoperla carnea Cocoons: A step forward in biodiversity preservation

Set to launch in 2024 and available on the market by 2025, the *Chrysoperla carnea* cocoons will broaden SAUTTER & STEPPER's product range. These cocoons mixed with buckwheat spelts in little hanging boxes can easily be introduced into various agricultural systems. Customers can choose from packages of 50 or 100 cocoons.

After about five days, adults emerge and commence mating, relying on honeydew, pollen, or nectar for sustenance. Females lay eggs within four to ten days, continuing for up to thirteen days. The larvae act as effective predators for approximately six weeks. Known globally for their pest control capabilities, they are resistant to various insecticides and remain active in various light conditions, making them suitable for diverse cultivation environments.

The cocoon stage is ideal for both conservatories and field-grown crops, and they contribute to the overall insect biodiversity of wildflower strips, which are increasingly important in the global agricultural landscape. Establishing a wildflower strip within or between greenhouses enhances the establishment of beneficial insects and supports pollinators. This method promotes biological pest control and fosters sustainable fruit and vegetable production. To effectively introduce *Chrysoperla carnea*, simply place boxes containing the cocoons within flower strips.

An optimal location for flower strips is along non-productive edges of greenhouses or within production rows. For a robust population of beneficial insects, early releases during the cultivation process are essential.

This method is particularly attractive for growers who rely on sustainable and environmentally friendly cultivation practices and want to offer their customers high-quality and ecologically responsible products. The introduction of lacewing cocoons into the SAUTTER and STEPPER portfolio underlines their commitment to innovative solutions in the field of plant cultivation and pest control.

Greta PRO - The completely home compostable plant pot with fertilizing effect

Specially developed for professional horticulture, Greta PRO is available in round with rim and thus pot machine compatible.

Greta PRO will survive a growing season of approximately eight to twelve weeks on accumulating and flood tables. When placed in the soil, the plant pot begins to decompose over time and evenly release a built-in nitrogen fertilizer to the seedling or plant.

Greta PRO is completely biodegradable and decomposes within three to six months (depending on soil conditions) without leaving any residue.

Phillyrea Angustifolia Greenquick®

Variety selected by LAFORET Pépinières, Phillyrea Angustifolia GreenQuick® is a variety with very dense vegetation and faster growth. Thanks to its good hardiness (minus 15 degree), its resistance to high temperatures (more than 40 degree) and periods of drought, this shrub has all the qualities of a hedge plant adapted to climate change.

With its shiny dark green foliage and its very good response to pruning, it offers all gardeners the possibility of a narrow, occulting hedge without constraints, even in town on a balcony. Phillyrea Angustissima GreenQuick® is also a very good alternative to boxwood for making topiary.

POLYGRAIN: The water-retaining granules (hydrogel)

POLYGRAIN is an all-in-one solution consisting of a storage medium enriched with nutrients and biological components. Polygrain can store up to 200 times its own weight in water and dissolved plant nutrients, effectively supporting plant growth even during extended dry periods.

The biological component is quickly broken down in the soil by microorganisms, while the storage medium decomposes more slowly. This results in both short-term and long-term effects, lasting over three years. This is crucial for the success of new plantings and their growth.

Avoids drought stress

Absorbs and stores up to 200 times its own weight in water and nutrients, allowing plants to endure longer dry periods.

Water and fertilizer saving

Water and fertilizers are used more efficiently, enabling up to 50 per cent savings in irrigation water and fertilizers.

Long-term effect

The high water and nutrient storage capacity provides long-lasting benefits in the soil for three to five years.

Faster and higher yields

Promotes root growth and development of young plants, minimizes the risk of plant loss in new plantings, and increases crop yields.

Maintains plant health

Supports the use of mycorrhizae and other beneficial microorganisms, reducing the need for plant protection products.

Sustainable and eco-friendly

Improves soil, is ecologically sustainable, and ensures high plant availability of stored water. Approved for food production in Austria under §9 DMG.

Biodegradable

Polysorb is fully and residue-free decomposed by microorganisms in the soil over time.

New to the Salvia Salgoon® serie: Lake Blueberry

The garden performance of Salgoon® is truly exceptional. This series offers sturdy and robust plants with many solid and well-packed flower spikes.

Known for its drought and heat tolerance, Salgoon® is continuously flowering from early spring to late autumn. As it can be grown quickly, it is one of the earliest Salvias to be available in garden centers from mid-spring onwards. Salvia plants bring instant excitement of liveliness in the garden, as they are a true pollinator magnet.

New to the Salvia Salgoon® series is Lake Blueberry. Salvia Salgoon® Lake Blueberry is a remarkable plant that captivates with its rich flowering and intense colour. Salvia Salgoon® Lake Blueberry truly stands out, combining its striking appearance with ease of care and impressive performance. This variety adds lots of volume but also stays compact.

2023 - The year of soil biodiversity

Many hobby gardeners are not aware of how important a healthy garden soil is for the environment, biodiversity and good plant development. CUXIN DCM is therefore launching an educational and soil test campaign for consumers.

Central components are an attractive secondary placement in the high-quality roll shelf and a free soil test campaign. In March/April, hobby gardeners are called upon to take soil samples and send them to CUXIN DCM. The company tests them free of charge and sends the results to the relevant retail store. The store will then provide advice and sell the product.

Rotary Nozzle System

Fu-Fong recently launched a smart fogging system, which uses a rotary nozzle driven by high-pressure water pump to create a wide range of fog at 360 degree. The fog particle are between 10 μ m and 20 μ m, which can maintain the stability of the pesticide or liquid fertilizer.

The accurate diffusion over the target plants effectively solves the following problems:

- | Agricultural labor shortage
- | Reduced risk of pesticide spraying errors
- | Saved water and pesticide or fertilizer costs
- | Achieved full automation of unmanned spraying in the farm

The rotary fogging nozzle is the best choice for fogging in the operating system.

New product range of organic fertilizers

Last year, AVEMA GmbH from Göppingen presented the ODP-N fertilizer for the first time, a slow-release fertilizer that releases nitrogen more slowly and over a longer period of time than comparable organic fertilizers such as horn shavings or sheep's wool pellets. In response to customer requests, the range has now been expanded to include so-called short and medium-term fertilizer variants, which mineralize nitrogen significantly faster and to a high degree within four and six to eight weeks respectively. Due to the natural modification of the collagen fibre without synthetic resources, the ODP-N fertilizer remains organic and free of plastics.

Very good results were achieved in breeding trials at the HWST Weißenstephan in a peat substrate. The release varies over time depending on the substrate and/or peat substitute and is linear and uniform, especially with peat substrates, despite the early release.

The new fertilizers are currently being tested in selected horticultural businesses and nurseries.

Of course, all AVEMA fertilizers are FIBL-listed and comply with the EU Organic Regulation. They also comply with the guidelines of the Naturland and EcoVin associations.

Happy with Calla

Elegant shapes, clean lines – Calla offers ample inspiration for a mindful moment in the madness of modern times and offers nothing but flowering, empowering happiness. The excellent reputation of this flower goes back to the Romans and Greeks in ancient times, who saw in Calla a gorgeous symbolic chalice for toasting to life.

Life is good

Calla is still seen as the bringer of happiness. It is a symbol for finding comfort and joy in small things: a fresh cup of coffee, a nice gesture, a sunny day, exchanging a smile with a passing stranger and all other things that make life a bit more beautiful every day.

Colour your day with Calla

The good vibes of Calla become even stronger when you add the magnificent colours of this flower. Red for love, pink for new beginnings, orange, yellow and green for joy, purple and black for a bit of drama and white for serenity and pureness. There are even bicolour callas, just in case it is impossible to choose. Lovely to get and amazing to give: there's nothing like sharing happiness.

pot packer: The packaging machine for potted plants

The company will be presenting a packaging machine for potted plants that it has developed and produced itself for the very first time.

The pot packer packs potted flowers and herbs so efficiently that horticultural businesses can increase their productivity by approximately 100 per Cent. Compared to manual hand packing, the same number of pots can be packed in just under half the time. This means that the available staff can be staff can be deployed efficiently and employees have time for value-adding tasks.

It should be particularly emphasized that the use of the pot packer does not incur any investment or rental costs for horticultural businesses. Billing is on a "pay per pot" basis, which means that the customer only pays a minimal amount when using the system. At the same time, they can save money from day one and thus improve their profitability. The pot packer is supplied with two lanes as standard and packs approximately 2,200 pots per hour. The uniform, automatic processing enables a uniform, crease-free appearance of the packed pot plants.

In contrast to standard packaging machines on the market, the pot packer is ideal for paper sleeves and can also be converted to film sleeves with very little effort. As many horticultural businesses have already switched from film to paper sleeves in the interests of sustainability or are planning to do so, the pot packer is the ideal machine solution for this target group. Thanks to its simple operation and fast setup, the pot packer can be used very flexibly. The WEBER Pack app, which evaluates digital analysis reports on the packaging process and visualizes the packaging performance quickly and clearly, is also particularly innovative.

This means that WEBER customers can now get everything from a single source: the wide range of bloom guard paper sleeves and the ideal packaging machine to go with them.

Compressed coco peat pellets

Pellets provide the best solution for hobby gardening, nurseries, hydroponics, and for forestry. Rather than using heavy potting soil, using these compressed coco peat pellets when planting seeds, propagating, or tissue culture is more advantageous.

Pellets are produced by Buffered Coco Peat with fertilizers which allow the seeds to germinate healthier and stronger at the initial stage. You will need to add fertilizers after six days of planting. The transplanting process is easier with these pellets as this eliminates the root damage, and saves time and costs. The seed germination is faster since there is a high water holding and high air porosity in coco peat.

These pellets are in a net covered and have different sizes of pellets that fit your requirements.

New for 2024 Clematis Guernsey Flute™ EviGsy153(PBR)

The exquisite large star-shaped, pure white flowers some twelve to 14 centimetre across, with red anthers are formed from May through to July, with reliable repeat flowering into September. With its compact habit and height of 90 to 120 centimetre, Guernsey Flute would make a wonderful addition to a patio, in a container, or in the mid to front of a flower border, growing through host plants, where it's longevity of successive flowers can be fully appreciated.

The modern clematis in the Raymond Evison range flower readily and will yield good results using relatively simple pruning techniques. In late winter/early spring simply reduce all stems down to 15 centimetre of soil level.

This exceptional clematis has an unusual but endearing trait of holding, just open flower buds, for an extended period, almost like a champagne flute, hence the use of 'flute' in its name. When flowers mature they open fully flat, with pointed sepals and of generous proportions. Unlike most white clematis, these blooms are exceedingly robust meaning they will not fade, mark or damage easily.

The Guernsey part of the name is reference to the variety being one of the first varieties to come out of Raymond J Evison's new breeding programme, at The Guernsey Clematis Nursery.

Granulate that can be dosed exactly to the gram: Sheep wool fertilizer for the professional sector

Sheep wool fertilizer has a nitrogen content of approximately ten per cent and is known for its long-term effect as well as its ability to retain water and loosen the soil. If professional users want to rely on these advantages, they need a product of reliable quality that works with the existing machines. In close cooperation with vegetable growers, biofertilizer professional Johann Falter has developed a granulate that meets the requirements of professionals.

The high nitrogen content makes sheep's wool fertilizer a preferred fertilizer for high-yielding crops. In the field of floriculture the long-term effect is particularly appreciated. Companies that want to rely on these and other advantages are faced with the challenge of finding a product that can be used with the existing machines. Fertilizer spreaders, dosing machines, fully automatic potting and filling machines need a fertiliser that flows well and can be dosed very easily. The sheep's wool fertilizer granulate from Falter Naturdünger with a diameter of four millimetre and a maximum length of five millimetre meets the professional requirements, as professional customers confirm.

The sheep's wool is processed in a CO2-neutral production process into pellets, granules or even sheep's wool fertilizer with KALI-Power - with 50 per cent sheep's wool and 50 per cent natural fertilizer. Falter Naturdünger is located in Upper Bavaria in Germany and stands for high-quality organic fertilizers for the garden and for professionals, produced from local and renewable raw materials without the addition of chemicals. The main products are sheep's wool fertilizer as well as natural fertilizer and bio-vegan fertilizer with raw materials from the company's own organic farming. Falter Wunschkünger offers a special service: Professional customers can have their individual organic fertilizer produced.

UV light at dibbler for disinfecting

To ensure that the sowing machines contribute to safer food production, Flier Systems introduce their newest option - a built-in UV-light. This UV light disinfects the drum materials and all the seeds that pass through the machine. With this option, you can protect your seeds and materials against micro-organisms and cross-contamination, during and in between batches.

Sowing is one of the core propagation processes when aiming for uniform plant growth. It is therefore of the utmost importance that each cell holds the right number of seeds. Double or missing seeds should simply be avoided. Furthermore, it is also important that the seeds are positioned correctly within the cell. Flier Systems offers a wide range of sowing solutions within the different cultivation domains that contribute to exactly that. The tested and proven solutions can be found at various young plant growers all over the world.

Vectorworks 2024: Faster workflows from start to finish

As one of the most modern CAD solutions, the latest version of the design software Vectorworks Landscape is designed to provide optimal support for landscaping companies in all project phases. New parametric tools, improved interfaces and a revised user interface ensure fast workflows - from start to finish.

The updated and modernized user interface makes working in Vectorworks more efficient and easier to customize. The reorganized View and Mode bars bring a wide range of tools to the forefront, so you can decide how to organize and have everything you need right where you need it. And Dark Mode is now available on both Windows and Mac.

A novelty for garden planning is the new parametric Fence tool. Optimized for simplified and detailed representations, the Fence tool supports integrated posts, gates, and terrain-conforming options like raked or panel/stepped. Save significant time while designing in 2D and 3D with accurate material reporting, reducing errors in material specifications.

3D modeling has always been a strength of Vectorworks. Experience more freedom when transforming your models. The new 3D Dragger will always appear in front of the selected objects for easy access, and contextual handles for translation, rotation, and scale provide comprehensive and intuitive ways to transform selected objects without disruptions. Additional modes like snap-free, planar, and auxiliary rotation options give you the control you need to make your modelling process smoother.

Vectorworks Landmark 2024 brings you a dedicated colour palette to provide beautiful, nature-focused colour swatches. You will be able to quickly access the colours you need to clearly communicate your design intentions, saving you time and letting you focus on your design.

Semponium: a ground breaking intergeneric crossing

Semponium 'Diamond' is a ground breaking intergeneric crossing between Aeonium and Sempervivum. It is the first officially recognized cross between these genera.

Semponium 'Diamond' has bright lime-green, striking leaf colour with contrasting red margins when exposed to the sun. 'Diamond' has a compact size and grows up to about 40 centimetre high and 40 centimetre wide. It grows to a beautiful dense, conical plant as the plant matures. One head produces an average of twelve offsets. The rosettes are large and strong, the leaves are thick, sturdy and glossy.

Overall, 'Diamond' is a very robust plant which is a great addition to any garden, rock garden, balcony or terrace. Place 'Diamond' in the sun to semi-shade in a well-drained soil.

Holiday breeze in the shape of an apple

'Tramin'-s- – the scab-tolerant early apple variety from South Tyrol in the Artevos assortment: The name not only reveals the origin of the apple variety from the well-known South Tyrolean village, but also promises flavours like the Gewürztraminer of the same name: aromatic, spicy, sweet, but at the same time with a noble acidity.

A very robust summer apple that is scab-tolerant (scab-resistance Rvi6) and only slightly susceptible to powdery mildew. The apples ripen about a week before the 'Gala', in the South Tyrolean Unterland at the beginning of August, and are characterized by their particularly long shelf life - in the cold storage until Christmas. The round to flat apples are very crunchy, juicy and have a good bite. The basic colour is yellow with an attractive, light red striped cheek.

Benchmarking 4.0

The benchmarking portal "Betriebsvergleich 4.0" is now available to all horticultural enterprises in Germany. With little effort you can avail of a routine check-up for your enterprise that reveals need for action and highlights where economic potential is not yet fully exploited.

You can also use the results from the benchmarking portal for communicating and setting goals for your staff. In addition you can show economic competence and your eagerness to develop the economic performance of your farm during loan acquisition.

The complete functionality of the benchmarking portal can be used anonymously, if you apply for an access token through the official extension service or your tax advisor. Using the portal is possible also independently by registering yourself. In any case, the use of the benchmarking portal is free of charge.

The portal is accessible at <https://benchmarking.zbg.uni-hannover.de> (in German only). Please check out the given example assessment reports for the different horticultural branches even without registration. The cockpit view gives an overview of evaluation results in terms of the four most relevant dimensions:

- | profitability in the current year
- | profitability in the past year
- | liquidity and
- | personal drawings.

Further gauges show productivity indicators in terms of labour, land and operating profit margin relative to the benchmark farm data from the network.

CLX V1000 grow light

The CLX V1000 grow light is composed of a dimmable led-lighting unit and a vertical ventilation system, which distributes heat and moisture evenly in a greenhouse. The unit creates a micro-climate around each plant, caused by the vertical air movement in combination with the adjustable light intensity. By properly linking the led-lamps in a total system, they form a cluster of climate cells that contributes to climate uniformity throughout the greenhouse and guarantees considerable cost savings - up to 35 per cent.

The spectrum of the CLX V1000 grow light includes green light, which combined with red and blue light results in a balanced and healthy growth of the crop. The combination leads to white daylight in the greenhouse, which closely resembles the characteristics of a spring sun. The green part of the spectrum causes a greater penetration depth of light, especially in the top of the plant, resulting in intense photosynthesis deep in the leaf and canopy, resulting in a higher crop yield.

Grow Trolley

The new Grow Trolley launched by Hotbox International provides a cost effective solution for germination, propagation and displaying plants.

The unit comes as standard with adjustable shelves, each shelf having a stal and plast ebb and flood tray.

The heatwave shelves will have a polystyrene base.

Above each shelf are two Philips Greenpower Production Modules which are controlled by a manual timer which can be set in increments of 15 minutes.

The product offers a number of additional options and permutations:

- | Ebb and Flood System
- | Heatwave - bench heating system

AgroCalcium®

AgroCalcium® is a liquid EC fertilizer, containing calcium and an optimized concentration of all its ingredients. It contains 20 per cent calcium (CaCO₃), 1,5 per cent wt. magnesium (MgCO₃) and up to 3,0 per cent wt. silicon, made out of microfine ground rock flour. Due to the reduced size of its component, there is a higher bioavailability for plants.

Advantages of AgroCalcium®:

! For ideal development and plant health, AgroCalcium® provides the precise amount of calcium needed. This is an important trace element.

! Giving plants healthy green foliage, AgroCalcium® can help plants recover from calcium chlorosis. To avoid calcium deficiencies, use AgroCalcium® from the beginning on.

! To save resources and protect the environment, AgroCalcium® was developed on nanotechnological basis. This allows the use of much less material and therefore adds in money savings.

! By combining AgroCalcium® with other products from B+H Solutions, the overall use of phytosanitary products can be reduced, thanks to their synergism of an optimized trace-elements-cocktail.

! Production with less residues.

AgroCalcium® was developed for use on all kind of crops.

It can be applied by foliar spray, via irrigation system or in combination.

General dosage each treatment is 1 litre per hectare.

Perligran Organic with organic soil activator

Perligran Organic consists of the high-quality volcanic mineral perlite and is a green all-rounder for soil and plants. Because of its many positive characteristics, it has long been popular in professional horticulture. Because it keeps plants and flowers permanently healthy and brings a rich harvest of vegetables and herbs out.

Especially in difficult planting conditions and demanding soils Perligran Organic is ideal. With a biological active ingredient booster combined premium perlite revitalizes the microbiology of the soil and supports its natural way of plant growth - from the roots to the leaves.

perligran.com/organic

- | Up to 50 per cent water storage capacity and good drainage
- | Revitalized microbiology and loosened soil
- | Ideal aeration of the substrate thanks to 95 per cent pore volume
- | Healthy plant growth and root development
- | More robust against pest infestation

SPH Transplanter: Efficient and precise transplanting

The SPH-Transplanter is an innovative solution that combines advanced technology with robust engineering to enhance efficiency and precision in transplanting processes. It is designed to meet modern horticultural needs and offers high capacity, durability, and hygiene-focused features.

Thanks to its modern gripper control system with a 25 per cent higher planting speed in the X-direction, the SPH-Transplanter significantly increases transplanting capacity without adding more grippers. Its Taylor-made gripper design ensures precise handling of various plant types, while a magnetic motion system eliminates motor wear, ensuring long-term reliability.

Key Features:

- | Enhanced speed and capacity with faster X-direction gripper movement.
- | Customizable grippers tailored to specific plant needs.
- | Robust frame for stability at higher speeds and easy maintenance access.
- | High-precision vision system (Aris) for thorough plant evaluation.
- | Compact gripper design, with a minimal spacing of 14 millimetre for high-density planting.
- | Optional features for hygiene and efficiency: Automatic gripper disinfection / Root guidance and disinfection units / Cross-contamination prevention programs.

With its speed, precision, and hygiene combination, the SPH-Transplanter sets a new standard for transplanting technology - offering exceptional performance at a great price-to-quality ratio.

PS Info MeinBetrieb new design and new functions

The online tool for the digital and legally compliant documentation of plant protection applications, which can be booked via hortigate, has been revised and adapted to current needs. The most striking feature is the new structure, which now also makes it easy to use on mobile devices.

From application planning to correct documentation in just a few clicks

Thanks to the direct integration into PS Info, the information on authorized crop protection products is always up to date. Suitable agents can simply be added to the digital digital pesticide locker. The required agent and water quantities are also calculated automatically for tank mixtures and deducted from the crop.

The scope of documentation, the division of the farm into different areas, employee accounts and much more can be defined in the settings. The system issues a warning if information is missing and provides information on requirements that must be observed.

The data entered is saved permanently and is available for download in pdf format.

The team offer a general introduction to the system daily at 11:00 a.m. at the stand.

Herbi® Living Soil

Behind the brand Herbi® are Frank and Michelle Lachmann. Michelle is from New Zealand, and Frank moved there eleven years ago. On their 14-hectare property in Urenui, they began growing vegetables and various other plants - all naturally and without using pesticides.

With great passion, Frank immersed himself in regenerative farming and soil health research, eventually developing what is now known as Living Soil. This laid the foundation for the Herbi® brand. From now on, Herbi® products will also be produced and brought to market through close cooperation with Floragard Vertriebs-GmbH.

The term "Living Soil" originates from the grower community but is also well-known in vegetable cultivation. It refers to the recreation of a living ecosystem - a healthy community of microbes working together to break down organic matter in the soil. This process releases valuable nutrients that promote plant growth.

Living Soil is easy to handle and guarantees success. It is sustainable, as it is reusable in combination with the Herbi® Living Soil Starter 4+4+4 fertilizer, and it is completely peat-free. Herbi® Living Soil and the corresponding fertilizers are now available in Floragard's product range.

Garland hydrangea: Unique growth and flowering character

The varieties Runaway Bride® and French Bolero® flower not only at the shoot tips, but from the second year onwards from each lateral bud. This growth and flowering habit renders them unique in the hydrangea world.

Brand recognition at the point of sale and in the media

The Runaway Bride® and French Bolero® varieties are present in European consumer marketing. Images, valuable content, press releases and advertising in social media are an integral part of the marketing portfolio of Cultivaris GmbH, which is in charge of the entire brand management. In this way, the sales activities of the production companies and the horticultural trade are supported.

Individual advertising for partners

A particular strength of Cultivaris lies in our targeted advertising campaigns for growers and distribution partners. For example, an individual brochure was produced for Plusplant in Germany and Hortival in France for insert advertising.

Advertisements from retail companies and point-of-sale advertising with brochures and posters are also accompanied.

The garland hydrangeas Runaway Bride® and French Bolero® are presented here:

The DCM AKTIV-ERDEN potting soil assortment in Bio-quality

Environmental friendliness paired with the highest level of quality: With the active soil line under the DCM brand, which can be used in controlled organic farming, Cuxin DCM focuses on sustainability. All recipes consist of high-quality, natural raw materials of regional origin. The company deliberately refrains from using coconut fibres and other non-regional and non-natural ingredients. The DCM active soils are fertilised with a purely organic 150-day slow-release fertiliser and contain naturally occurring, root-activating mycorrhiza fungi.

The use of the plant-based, renewable raw material Sphagnum moss in selected soils is innovative. Similar to a sponge, this natural water storage miracle can hold 20 times its own weight in water. In addition, it is light, structurally stable and ensures a loose structure of the soil. For the sake of the environment, all DCM active soil formulas are peat-reduced by at least 30 per cent. The packaging in modern design consists of 80 per cent recycled plastic.

Fine dust filter for biomass-firing systems

The fine dust filter NGFL is offered in a compact and modular design. The filter is available for automatically fed, powerful wood firing systems. This fine dust filter works with microporous ceramic filter elements for highest separating performance of up to 99,99 per cent. This means in practice often dust content less than 1 mg/Nm³ of flue gas, so it's hardly traceable.

The functioning in principle is easy: The hot gas is drawn from the outside to the inside through the filter elements, in this procedure dust particles are deposited on the outer surface of the ceramic elements. The automatic, time or difference pressure controlled cleaning of the filter elements is made by compressed air. An automatic, de-ashing in function of the ash quantity is made by ash screws or pushing ram into mobile ash collecting containers beside according to the customer's desire.

Advantages:

- residual dust quantity
- no cyclone pre-separator needed
- ceramic filter elements temperature-resistant up to > 1000 degrees and completely insensitive towards burning and flying sparks
- automatic time and difference pressure controlled cleaning of the filter elements by compressed air
- automatic ash removal depending on ash quantity by ash screws or pushing ram into ash containers placed besides
- retrofittable
- compact, modular design
- meets the requirements of all currently valid eligibility programs

- also suitable for fuel of the fuel groups 6 and 7 (according to 1. BImSchV)

- remote maintenance optional

Balterra Coir substrates

Coir Pith Blocks

Coir pith blocks are an eco-friendly, sustainable solution for plant cultivation, offering exceptional water retention and aeration properties. Derived from coconut husks, these blocks are ideal for horticultural applications. Aged and refined in well-maintained bed yards, the coir pith ensures physical stability and is free from contamination by weeds, seeds, or nematodes.

Coir Husk Blocks

Coir husk blocks are made from high-quality coir crushes, ranging in sizes (0 to 7 millimetre, 4 to 14 millimetre, 10 - 15 millimetre). These blocks are designed to improve aeration within growing media by increasing air content by up to 40 per cent, depending on the mix. Perfect for ensuring robust plant growth, they can be tailored to meet specific horticultural needs.

Coir Mix Blocks

Coir mix blocks combine coir pith with coir husk crushes or short coir fibers to create a tailored substrate for optimal plant growth. These mixes, such as the popular 80/20 or 70/30 ratios, ensure uniformity in air and water distribution, resulting in healthy and evenly developed roots. Available in 5 kilogram blocks or growbags of any size, these mixes are customizable to meet specific client requirements.

Coir Growbags

The Coir Growbags are a premium solution for professional cultivation and home gardening. Designed for convenience and performance, these grow bags provide an optimal mix of coir pith, husk chips, and fibers to suit specific crop needs.

New full-LED grow light

The new CLX-2-3ch full-LED grow light from Climalux will be presented for the first time.

The new CLX-2-3ch light is equipped with three switchable channels, which you can activate independently of each other. Like the existing CLX-2-1ch, the new light features SMD LEDs mounted on a single LED engine. Both lights have a higher light output and offer the grower an array of light spectrum options. The CLX-2-3ch grow lights are now available and can be supplied in any light spectrum required, with a maximum efficiency of 4.1 $\mu\text{mol/J}$.

All Climalux grow lights consist of a dimmable LED lighting unit and a vertical ventilation system that ensures uniform distribution of heat and moisture throughout the greenhouse. The light intensity and fan speed can both be controlled independently and steplessly.

Climalux is established in the Netherlands and fully focused on the development and production of high-quality full-LED grow light systems for vegetable cultivation and ornamental horticulture. The complete system is supplied, including CLX-2 grow lights, a control unit and power supply unit. Local technicians will install the system, under supervision of the Climalux team.

Paulownia 'Elongata' Futuro (CO2-TREE)

The Paulownia 'Futuro' grows fast. Three months after planting a twelve centimetre plug, the plant reaches a length of +/-1.65 metre. Heavier soils are no problem for 'Futuro'. Regenerative, post-harvest regrowth occurs on cut trunks.

Bio-based solution

- CO2 rights, Carbon-Credits can be obtained at planting.
- 8000 trees and 40 fruit trees per hectare, 300 CO2 certificates.
- 820 trees and 40 fruit trees per hectare, 150 CO2 certificates.
- Fibre production, biomass.
- Wood production in nine years trunk diameter 40 centimetre.

The power of working together

A good start with good starting material is decisive for successful cultivation. That is why guidance during the cultivation of Paulownia elongata 'Futuro' is offered.

Contemporary home accessories for spring

This spring, Hendriks Deco offer a wide range of new decoration items.

Bamboo vases: They are ideal for decorating with dried flowers such as pampas grass or silk flowers. These vases are available in different colours (red, green and mixed colours) and sizes (like table vases).

Terra cotta: All pots are unglazed, ceramic and have an earthy to reddish colour. As the pots are made in the traditional way, they are all unique: the colour can vary from pot to pot and they have small blemishes. Not only houseplants but also small ornamental plants and olive trees fit perfectly in terra cotta pots.

Metal pots/bowls: These items are available in green, blue and brown. A must-have for anyone who loves colour. All planters have a shiny design and fit perfectly into a modern interior. The two series are available in different prices and shapes.

Glass bottles set with metal basket: These vases can easily be decorated with flowers, and they also look great on wedding tables. Some items are suitable for flowers as well as for plants such as succulents, flower bulbs and orchids.

Due to continued success, some zinc collections will also be available again.

Cold tolerant crops

In these times of rising energy prices it is smart to focus on products developed for production in the cold season to keep production costs as low as possible. The breeders from Schoneveld developed crops that perform excellent under colder and darker circumstances. These require low energy input and still deliver outstanding quality.

Come see Super Serie Mini Winter, Picasso, Macro and Vintro. You will be amazed by their performances. The Schoneveld's growing supporters are there to help you with the adjusted cultivation protocol. Outside the range of Cyclamen there is a broad choice of crops that perform well with low input of energy. Think for example about Primula Paradiso and Ranunculus Sprinkles.

PSB Anatolia 2025 International Landscape, Ornamental Plants, Garden Arts and Equipment Fair

After the Sakarya Landscape and Ornamental Plant Festival, which was held three times between 2018 and 2020, in 2021, PSB Anatolia Landscape Ornamental Plants and Garden Equipment was organized for the first time as a 'National Specialized Fair' with its content.

PSB Anatolia brings together new trade opportunities in the field of landscape and ornamental plants at both national and "international" levels. The B2B meeting rooms, VIP meeting rooms at the fairground provide opportunities for productive discussions for new business opportunities. Additionally, PSB Anatolia aims to bring together participants specializing not only in plant species but also in landscape equipment and machinery, offering a wide range of products. Continuing to be an ideal point for following new products and trends by bringing together the dynamics of the sector, PSB Anatolia maintains its feature.

To bring together all elements of the industry, PSB Anatolia Fair organized the Design and Application Competition with the participation of landscape architecture students. This competition holds the distinction of being the first design competition organized for 'ornamental plant fairs' in Turkey. Aimed at providing future landscape architects with professional experience, the competition is carried out with broader participation and a much more comprehensive content in collaboration with universities and the Chamber of Landscape Architects of TMMOB.

Sphaxx: Premium raw material meets sustainable innovation

With Sphaxx, Klasmann-Deilmann presents a pioneering growing solution that meets the criteria of sustainability, supports optimum plant growth and is characterised by easy handling. Sphaxx is produced in an innovative manufacturing process from very pure sphagnum, which comes from controlled cultivation and is not taken from peat bogs.

In terms of plant cultivation, this new raw material has excellent air and water retention properties and a low pH value. The fully controlled, sustainable production ensures consistently high quality, reliable purity and increasing availability. Sphaxx will initially focus on the cultivation of orchids, with other product solutions in the pipeline.

AS 1200 - new spraying procedure for plant protection

With the AS 1200, Birchmeier Sprühtechnik AG has developed a new device with air-supported spraying technology. The device combines the benefits of conventional nozzle spraying with a controlled air stream. As distinguished from a mist blower it uses the very latest electronics and rechargeable battery technology.

At the heart of the AS 1200 is an easy-to-use, portable blower with an electronic control system and an integrated spray nozzle. Spray solution is fed into it at a pre-set pressure via a hose from a rechargeable sprayer and mixes optimally with the air stream. The blower power can be set to various levels depending on the application. From a gentle breeze when working next to a wall of leaves, to a powerful hurricane, when working at a distance of ten metres or more - everything is possible. With this new process, users can penetrate existing plants better. The AS 1200 is quiet and produces no exhaust gas.

The blower is designed as an additional device and works together with a sprayer from Birchmeier's «Accu-Power» line. These rechargeable devices developed by Birchmeier in recent years have received a number of international prizes for innovation. Anyone who owns a rechargeable backpack sprayer from Birchmeier can combine it with the blower. However, the blower requires an additional high-performance rechargeable battery. This is designed to allow several hours' spraying depending on the blower's power setting. The latest electronics ensures straightforward, reliable operation. This device too is "Made in Switzerland".

Nature's Melody - Symphony Tunes

New in the Nature's Melody range at Wagner Life Design is the Symphony Tunes wind chime.

The handcrafted Symphony Tunes wind chime convinces through its elaborate workmanship and high-quality finish. The five thick tubes made of partially recycled aluminum are finished with a premium powder coating. Each tube is precisely tuned. The canopy and the sails are made of rubber wood in walnut color. Through the four clappers a symphonic, long-lasting sound is achieved.

The wind chime is suitable for in- and outdoor use.

The article SYM48BK has the dimensions 19 x 19 x 121 centimetre and weighs about 2.1 kilogram.

RAINOS: The autonomous Watering Robot

The RAINOS watering robot from Innok Robotics is revolutionizing irrigation in the green sector, particularly in cemeteries, tree nurseries and parks. It has been further developed for IPM 2025 so that even smaller businesses, like with 200 or more graves to water, can now benefit from the robot immediately.

Another new feature is the increased variability of the RAINOS, as it can now reverse out of narrow paths while maintaining the highest safety standards for humans and animals.

The robot navigates autonomously to the areas to be watered and supplies them precisely and individually with the required amount of water. This significantly reduces the workload on staff and minimizes water consumption due to the usually night-time watering and targeted irrigation.

When its water tank is empty, the RAINOS refills automatically at the Innok refuelling stations. By using the RAINOS, a cemetery nursery was able to reduce the amount of work involved in watering by over 70 per cent while optimizing water consumption and generating new revenue through watering orders.

Practical accessories for the AS 1200 rechargeable spray blower

The AS 1200 rechargeable spray blower has proven extremely popular on the market and earned Birchmeier Sprühtechnik AG several awards on account of its innovative design. The manufacturer has recently introduced a flat spray attachment for the spray fan to enable users to apply the product even more efficiently over large areas.

Birchmeier has developed a practical, flat spray nozzle attachment for the AS 1200 rechargeable spray blower. With the new accessory, users can now spray vertically or horizontally – depending on the height or width of the crop. The integrated flat spray nozzle produces a flat spray pattern that can be used to treat specific areas. Applications show that this further improves the wetting of the upper and lower leaf surfaces, and the attachment helps to cultivate crops with even greater efficiency, especially in ornamental plant cultivation and winegrowing.

In addition to the flat spray nozzle and the corresponding lamella attachment, the set also includes a quick-release coupling to easily replace the nozzle.

Birchmeier also offers a retrofittable quick-change nozzle system for existing appliances. This makes it easy for users to change the nozzles in the blower to use it for crops.

Multi-use, traceable packaging solutions for your supply chain

Newwen is introducing multi-use traceable packaging solutions to replace single-use packaging. Multi-use packaging that is circular while retaining residual value and equipped with digital technology.

The plastic material features a linked RFID, barcode and QR code tag for tracking and recording movements or locations.

The material is fully reusable and retains residual value.

Newwen's products contribute to circular energy-neutral logistics and make your internal and external processes more transparent and efficient.

- | Full-colour printing
- | Customisation options
- | IoT: digital technology for optimal supply chain management
- | Multi-use is more cost-effective than one-off
- | Suitable for automated handling and mechanisation
- | Can be made flat or foldable, saves storage and transport costs, CO2 and time
- | Free scanning and logging app to link data to your own ERP system
- | Footprint proof
- | Damp-proof
- | Antibacterial
- | Antistatic
- | Residual value
- | 100 per cent recyclable

The solution for circular energy-neutral logistics.

New: Gramoflor peat-free tomato and vegetable soil

The focus on peat substitute products is also reflected in the hobby segment: Gramoflor present the new tomato and vegetable soil, the first soil in the conventional range of Gramoflor hobby soils that absolutely meets the political and climate protection-driven requirements for peat-free soil.

Self-sufficiency with one's own vegetables has been the trend among young and old for quite some time and the current massive increase in food prices will further strengthen this development. The demand for suitable soils for growing vegetables in raised beds, tubs or balcony boxes will therefore increase in the coming season. And so the new Gramoflor peat-free tomato and vegetable soil with a modern design and a convenient 50 litre bag comes just at the right time.

The recipe of this soil has been convincing active and also new hobby gardeners for a long time when growing their own for example tomatoes, cucumbers, peppers, aubergines, courgettes, pumpkins as well as chillies and chilli peppers. Supported by a mineral fertilizer, the so-called "heavy growers" in particular receive the best possible care. Here, an organic fertilizer quickly reaches its limits.

Peat-free soil does not necessarily have to be organic, because many customers want a simple sense of achievement with a good enough harvest of tasty vegetables.

Instead of peat, the peat-free tomato and vegetable soil uses the tried and tested peat substitutes LIGNOFIBRE® wood fibre, cocopeat and quality compost.

In addition to the peat-free organic soils, which have already been available from Gramoflor since 2013, this soil is thus a further milestone on the way to the year 2026, by which time the BMEL (Federal Ministry of Food and Agriculture) will only require peat-free hobby soils on the market.

Flower bombs for more colour

With the brightly colored seed 'bombs' from Blossombs you create a true sea of flowers and food paradise for bees and butterflies. Throw the Blossombs anywhere you want flowers; in the garden, on the balcony or a vacant piece of land (the flower bombs may not be sowed in protected nature reserves.), wait for the rain (or use a watering can) and after a few weeks you, the bee and the butterflies will enjoy the most colourful flowers.

Made in the Netherlands with organic wild flower seeds and natural clay, nutrients and colour pigments.

Blossombs can be thrown outdoors at any time of the year. The seeds will germinate in spring. Flowering time: April to October.

LIMEX Horticultural label - sustainable, durable, and versatile

LIMEX Horticultural Labels are innovative, low-environmental-impact labeling solutions designed to meet the needs of the horticultural industry. Made primarily from calcium carbonate (limestone) and utilizing minimal petroleum-derived materials, LIMEX labels offer a eco conscious alternative to traditional plastic labels.

Key features and benefits:

Eco-conscious composition: Manufactured from limestone, a globally abundant resource, LIMEX reduces reliance on petroleum-based materials and contributes to lowering CO2 emissions.

Cost-effective sustainability: Offering competitive pricing without compromising environmental benefits, LIMEX helps businesses achieve their sustainability goals without increasing costs.

Water resistance: Perfect for outdoor and greenhouse environments, LIMEX labels are highly resistant to water and weather, ensuring durability in challenging conditions.

Durable and long-lasting: LIMEX labels are robust and maintain their integrity under prolonged exposure to sunlight and moisture, making them ideal for extended use in plant nurseries and gardens.

Vivid vibrancy: Delivers vibrant colours, perfect for visually striking prints such as labels and packages which stand out beautifully.

BOX.3 - The design statement for every wall

BOX.3 is more than just a decorative wall module - it is the perfect symbiosis of innovative design, real plant greening and sustainable functionality. Developed for the premium market, the patented BOX.3 transforms walls into living works of art that are eye-catching in both living spaces and commercial areas. With its clear lines and timeless elegance, the module blends into any environment and can be customized with variable sizes and surface designs.

The modular system impresses with its sophisticated design and user-friendliness: the central watering hole and the capillary system supply all plants with water evenly - regardless of how many modules are combined on top of each other. An integrated water level indicator minimizes the maintenance effort and makes plant care easy. From installation to planting and maintenance, BOX.3 is an uncomplicated and long-lasting interior highlight that has been developed with plant experts and design professionals.

BOX.3 opens up a wide range of sales opportunities for retail partners: the modular concept enables attractive additional sales, such as seasonal plants, substrates and care products. Whether at the point of sale or via dropshipping in the online store - BOX.3 adapts flexibly to all sales strategies. Retailers also benefit from a strong sustainability story and extensive marketing material that can be seamlessly integrated into existing concepts. For B2B customers, the product offers additional sales potential as a service model with a plant subscription and care option.

BOX.3 combines the demand for high-quality design with sustainable production. No power connection, no complicated installations - the system is ideal for discerning private customers, stylish reception areas or inspiring accents in cafés and restaurants.

Total IPM solutions for sustainable, healthy ornamentals

The ornamental sector faces growing challenges as growers strive to produce high-quality crops while reducing chemical residues. Limited availability of broad-spectrum pesticides, the rise of secondary pests as primary threats, and the demand for flawless plants have added complexity to crop protection. To address these challenges, tailored solutions are more critical than ever. Biobest present their Total IPM solutions. Their comprehensive approach equips growers with all the tools they need to protect their crops sustainably and effectively.

These solutions include:

1. Monitoring and scouting

- ▮ **Trap-Eye™**: Automates sticky trap monitoring
- ▮ **PATS-C**: Tracks flying moth activity automatically
- ▮ **Bug-Scan®**: Sticky traps and rolls for pest detection and monitoring of populations

2. Pest and disease control

- ▮ **Vespiformis-system**: A targeted biological control solution for leaf-dwelling thrips species

3. Application techniques

- ▮ **Entomatic™**: Automates the dispersion of biological solutions, reducing labour and improving efficiency

Together, these tools are designed to tackle the most pressing pests in ornamentals, including invasive thrips, leaf miners, and caterpillars, providing growers with sustainable, efficient, and effective crop protection.

Biobest remains at the forefront of innovation, delivering solutions that empower growers to meet the challenges of today while ensuring a sustainable future for ornamental production.

IOT4H2O: Universal data collection with IOT

IoT4H2O® (pronounced "IoT for water") are small, low-cost data acquisition and transmission devices that communicate via LoRaWAN or NB IoT wireless standards and can be equipped with a variety of different sensors.

IoT stands for Internet of Things. IoT data acquisition systems transmit the acquired measured values via radio and make the data available in a data cloud.

The IoT4H2O® devices thus enable both the inexpensive new construction of wireless data acquisition systems and the equipping of existing sensors with wireless data transmission capabilities, thus bringing the company's own data acquisition to a new level. Outdated handheld readers or data loggers without wireless data transmission can be replaced while continuing to use existing sensors. In this way, resources are saved.

The IoT4H2O® devices use the IoT narrow band standards LoRaWAN and NB IoT. These radio standards are characterized by extremely low power consumption, low costs, high range, data security and an unprecedented penetration of obstacles, and are therefore ideally suited to the requirements of data acquisition in agriculture and horticulture and generally in the outdoor area.

Agriware - the '360° cost controller'

The '360° cost controller' is an advanced dashboard in PowerBI in combination with a data warehouse that brings together all relevant data, and standard reporting templates. It comprises a lot of intelligence to calculate complete cost prices including different cost categories and the allocation of indirect costs. It is a typical low-smart-tech solution, because its innovation is not really in hardware but in data management and analysis.

The '360° cost controller' is a plug and play solution, that is very easy to implement. However, an important prerequisite is the usage of Agriware BC. This is a modern ERP-system, that provides a fully integrated business data backbone for the core business processes of a company, and that requires a major implementation.

Spical Ulti-Mite: New sachet improves spider mite control

Following the success of a newly patented packaging concept by Koppert Biological Systems, [Spical Ulti-Mite](#) is now available in a high-tech foil sachet that ensures consistent performance in variable climatic conditions. Compared to other regular paper sachets in the market, the Spical Ulti-Mite foil sachets perform up to three times better. Trials have proven that Spical Ulti-Mite consistently delivers higher numbers of predatory mites under challenging conditions.

Extensive research has resulted in a sachet that creates a better environment for the predatory mite to build up its population. The superior quality of the foil ensures the breeding system is better protected against environmental conditions that may affect the mites emerging from it. The sachet is narrower and slightly longer and gives the mites the very best conditions to develop even more swiftly and strongly.

Spical Ulti-Mite, which is widely used to control spider mite in a variety of greenhouse crops, can now also be applied to outdoor crops such as citrus and grapes. With the introduction of Spical Ulti-Mite, Koppert aims for more security for both grower and crop.

The new Spical Ulti-Mite sachets can be disposed of together with the crop waste. The sachet is made of a newly-developed foil that conforms to the required industrial compostable standards. In addition, Koppert Biological Systems has reinforced the hook from which it can be attached to make it even more robust.

New: MAX BIO binding tape

MAX BIO Tape 13

- Biodegradable according to DIN13432
- Biobased (from renewable resources)
- Consists of a compostable and biodegradable polymer and polylactic acid (PLA) which is made from corn or other sugar containing plants
- Durability on the plant about one and two years
- Is degraded by microorganisms and their enzymes
(degradable in the composting facility within a few weeks, lying on the ground takes longer - depending on the weather)
- Cuts easily even in hot temperatures
- Thickness: 0,13 millimetre
- Length: 30 metre
- Colour: brown

New: Chain lock tree ties

Tyne Moulds chain lock is a quick and easy tree tie system to secure trees and shrubs when planting and landscaping.

The chain lock can be secured to a tree stake or post by threading the belting through itself. The tree ties are available in several different sizes to suit all needs in the field, making this a must have for all growers. Available in black only.

Sizes available:

- CL12 1.2 centimetre x 25 metre(20 coils per outer)
- CL12HD 1.2 centimetre x 25 metre (20 coils per outer)
- CL25 2.5 centimetre x 25 metre (five coils per outer)
- CL25HD 2.5 centimetre x 25 metre (five coils per outer)

Ballerina's®

Breeder Dümme Orange presents a varied mix of annuals, perennials and pot plants, including a preview on the new 2023 assortment. The star of the show is Ballerina's®, the new Fuchsia series with its strong, day-neutral and well branching plants that are naturally compact.

Ballerina's® are perfect fuchsias for early production, and therefore form a promising market with high sales potential. The new series performs extremely well on balconies and terraces or in flower beds and borders.

Ballerina's® bloom reliably and persistently from early April to August. Their individual, pretty, medium-sized flowers attract bees and other pollinating insects throughout the whole summer season.

Romeo - ecologically strong against fungal attack

Romeo® is a biofungicide that contains the patented active ingredient Cerevisane®. The active ingredient consists of cell walls of the yeast strain *Saccharomyces cerevisiae*. Cerevisane® induces the plant's own preventive defense mechanisms against key diseases.

It is approved for growing vegetables in greenhouse, in ornamentals in open field and greenhouses as well as on lawns incl. §17 against downy and powdery mildew and botrytis. With Romeo® the vegetation period can be optimized effectively and ecologically. Pesticides can be reduced to a lower level without effects in yield. It also offers the possibility of effective resistance management and thus helps to protect the existing active ingredients and avoid potential residue issues. By taking preventive measures, you avoid damage to plants, beneficial insects, and soil life, which is essential to secure future yields.

In field tests it has been able to determine an increased effectiveness of Romeo® in combination with specific fungicides (sulfur, copper and chemical agents), which is why Romeo® is explicitly recommended to support and improve existing strategies. Phytotox damage is not to be expected from Romeo®.

It has been proven to help reduce copper, prevent resistance and switch the active ingredients without questioning the quality of the strategy. Since Romeo® does not contain any living organisms, it is ideal as a mixing partner in the tank mix or for alternating application. For the best possible effect, it must be used preventively. Depending on the pressure, it has an infestation-reducing effect on its own.

SmartFlo Floormanager: The solution for more efficient and sustainable cultivation

The horticulture industry worldwide faces increasing challenges, including rising labor costs and a shortage of skilled workers. As wages continue to rise in various countries and labor markets become tighter, automation in horticulture is becoming essential for controlling costs and streamlining operations. The Floormanager, developed by WPS, offers an innovative solution designed to meet the demands of modern growers across the globe.

What is the Floormanager?

The Floormanager is a patented, state-of-the-art system designed to automate essential processes such as pot placement, spacing, and handling. Lightweight, flexible, and fully customizable, the system seamlessly integrates with automated solutions from WPS or other suppliers, offering unparalleled adaptability for growers. Its innovative design promotes sustainability by reducing labor demands, enhancing efficiency, and ensuring consistent handling of potted plants.

Key benefits for horticulture businesses

- | Labor savings: Automate repetitive tasks to address labor shortages and reduce labor costs
- | Enhanced efficiency: Accelerate plant handling processes with precise and consistent performance
- | Customizable and flexible: The Floormanager adapts easily to existing systems and specific grower needs
- | Future-ready technology: Expandable for advanced functions like automated crop care, pest management, and order processing
- | Sustainability: By automating physically demanding tasks, the Floormanager supports a healthier work environment and a more sustainable business model

Three new Raymond Evison Clematis varieties

The world-renowned clematis breeder and producer, Raymond Evison Clematis Ltd, presents three new varieties from their 2014 Evison Guernsey breeding programme: Clematis Baroness Fookes™ EviGsy156(PBR), Clematis Bridgewater™ EviGsy155(PBR) and Clematis Elpis™ EviGsy154(PBR). All three plants will be on display on the booth, in flower, to view. These will be the 4th, 5th and 6th releases from the Evison Guernsey breeding programme which has produced stunning clematis from the new genetics.

As a global supplier of young clematis plants, the sister company The Guernsey Clematis Nursery Ltd offer a full range of 3 centimetre Ellegaard plugs and twice pruned 7 and 10 centimetre liners. Sound technical cultivation advice as well as marketing and PR support with true-to-type images and descriptions are given.

The greener side: Botanical by Scheurich

Botanical by Scheurich now expands the popular Urban Jungle, with the new Tropical Garden and Palm Garden, making the presence of green plants once again a lifestyle choice with the feel-good factor guaranteed. The broad-leaved decorative pot designs appear realistic and are eye-catching a real recipe for relaxation. They are perfectly suited to the zebra plant (*Calathea zebrine*), monstera (*Monstera deliciosa*) or parlour palm (*Chamaedorea elegans*).

Green living knows no boundaries. A natural lifestyle harmonises wonderfully with Scandinavian design and transforms a classic, cosy atmosphere into the on-trend "Hygge", and everyone can use a little more of that! Botanical is available in sizes up to XL and makes greenery centre stage without compromises. Put on the floor, small urban-living gardens emerge, which create fresh air so that you can breathe and relax.

Pictures, pillows and blankets featuring leaf motifs as well as use of the colour sage green, co-ordinate well with these new cover-pots. Interesting arrangements can be created by combining Tropical Garden and Palm Garden with the popular Scheurich cover-pots in Panna and Anthracite.

To keep the green oasis dry, these high quality cover-pots are manufactured from 100 percent waterproof ceramic.

Everlasting beauty

For some cut flowers are wasteful and they do not accept artificial flowers. For this Blumeden has developed a new technique of preserving real natural flowers.

They are not dyed like others who do, but they have "drunk" the solution that will keep their petals and leaves soft and beautiful for many years.

The Hydra is offered of at least 20 centimetre with a single stem, and can be decorated with other flowers.

ReGrow and Microgreens

A new trend in the kitchen and cooking is using home grown plant tops, called ReGrow. This kind of growing can be called sustainable, because it uses the regeneration property of plants as for example regrowing of new tops, which can be further used for cooking. This kind of growing is not based on growing from seeds, but from kitchen scraps. What vegetables are suitable for ReGrow? All root vegetables as carrots, leeks, celery and spring onions.

Microgreens are small plants that contain a large quantity of vitamins, minerals and antioxidants, especially vitamins C, D, E. The plants have an attractive look on the place, their taste is similar to that of adult plants. Try the fresh taste of rocket, radishes, kohlrabi or red cabbage. The product is made in two variants: from the virgin material and from the virgin material with an admixture of coffee grounds.

Mairol TerraMicro

Gardening using this brand is efficient, very qualitative and brings joy to the result. The traditional German company offers a selection of biological products in addition to classic fertilisers.

One of these is Mairol TerraMicro, a soil activator with a large proportion of natural microorganisms and high-quality humic and fulvic acid. It loosens the soil and increases its fertility. The product also promotes root formation and contributes to the fertility, health and improved nutrient uptake of plants.

Use outdoors from March to September, indoors all year round. Application to the surface is sufficient. For new planting, apply directly into the planting hole.

GreenPlan

Manage your production planning and economic forecast: GreenPlan is a planning software designed for pot plant growers.

GreenPlan is highly focused on precise timing of sale and has a number of features making it easy to assure that the right mix of varieties and colours will be available in due time; it makes it immediately visible for the planner, whether a production is candidate for up scaling or down scaling.

- | Forecast earning at crop level
- | Plan after your peak sales
- | Planning on day or week level
- | Overview of production and consumption of cuttings
- | Multiple cultivation recipes per variety
- | Graphical plan over your space consumption
- | Calculate the culture's consumption of heat, electricity, CO2 and growth light
- | Price calculator for Added Value

Benefits for the user:

- Easy use
- Easy look at planning alternatives
- Production plan and budget in the same process
- Quick overview of profit, costs or hours consumption
- Quick presentations to colleges on screen or handouts

Green Trend Report 2022-2023: An inspiring forecast for the industry

In this third edition, elho group, Floramedia and Royal Lemkes uncover the strategic opportunities these developments offer the horticultural community.

To stay relevant in a rapidly changing world, entrepreneurs need to anticipate the future. Trends are a kind of future scenario: they provide information about the mood in society, in the market and among consumers. Insights into trends can help to develop a future-proof vision for one's own company and provide inspiration for successful product innovations.

In the Discovery Center of IPM Essen, you can be inspired by the trends, colours and materials of the Green Trend Report. And would you like to know how you can use these trends, how you can convert them into a brand or a product? The account managers and Art Director are at your disposal with advice and practical help.

Climate Gardeners Mix - Ready-made solution for Climate adaptive planting

Climate Gardeners powered by Rijnbeek Perennials presents the climate proof plants mix for the interested and innovative garden centers in Europe. With inspirations from the wild, it is possible to create low-maintenance plantings for a high range of diversity in the garden. Plantings which don't require a lot of irrigation, but do bring a cooling and decorative value with blooming throughout the seasons and nice winter features. Plantings which are important to biodiversity and whom can survive future extremities of climate change and even benefit from it.

The idea behind these arrangements is to easily increase the green space within gardens by creating a personal landscape design package with climate adaptive solutions by introducing a simple planting concept for low maintenance.

The concept for these arrangements is to give people a simple method to broaden their greenery in the garden with a miniature landscape design effect.

Rijnbeek and Son Perennials Export want to create a bridge between creative and inspiring landscape design directly with the private gardens.

All the plants are grown in 100 per cent peat-free mix and chosen with the utmost care. Because of this you'll receive an exclusive mixture of perennials which are not easily found nor available in every garden center.

Based on a rotating method the company deliver new and interesting mixtures every month, you can rest assured that you won't find the plants easily elsewhere and offer your customers a truly unique assortment.

FiberCell Batch Mixer

The new FiberCell Batch Mixer is multifunctional with an integrated feeding belt. The FiberCell Batch Mixer has exchangeable wear plates which are easy to replace and easy to handle. The machine is automatized with a digital control system and remote access system. The watering unit has a built-in timer where it is easy to set the desired time for watering of the substrate. For the FiberCell Batch Mixer no compressed air is needed which makes the machine more silent.

Growing substrate in containerized nurseries supplies water, oxygen, mineral nutrients, and physical support to the plants. To achieve the characteristics of an ideal substrate for containerized plant production, organic and inorganic components are generally mixed together. Organic components include peat moss and composted organic materials like bark, saw dust, rice husk, coconut husk and sugar cane bagasse. Inorganic components include Perlite, vermiculite, and other inorganic materials like sand, pumice, rock wool and polystyrene flakes. Additives such as slow-release fertilizers or dolomitic lime (for pH correction) can also be added to the mix. Even and homogeneous mixing of these components ensures an increase in seed germination rate, rooting success with cuttings and even development of plants in the nursery, minimizing losses.

Infinity: the new generation of plant containers

Infinity is a revolutionary range of plant containers that are the result of a visionary collaboration between Lucart and Pasquini & Bini. Together with the contribution of the Department of Agricultural, Food and Agricultural-environmental Sciences at the University of Pisa, this range of plant containers, made from GranPlast, is a momentous change in the horticultural world, thanks to its positive ecological impact.

Infinity plant pots provide a positive environment for plants to grow in, promoting phytostimulation and improving root health. These plant pots regulate root temperature, creating optimal conditions for the plants to grow. Infinity plant pots reduce the extent to which the substratum inside the pots overheats during the summer months, recording temperatures that are on average five to seven degrees lower than black pots, with peaks of ten degrees during the hottest hours of the day. This is of considerable benefit to the plant roots, and for their health in general, reducing stress to a minimum.

The total lack of carbon black simplifies disposal on completion of cultivation, making Infinity plant pots a sustainable choice. The plant pots have passed all the Institut Cyclos' recyclability tests.

Innovation and automation in weed control

Mantis ULV-Sprühgeräte GmbH, the recognized manufacturer of MANKAR ULV-systems and by now also well-known for environmentally friendly weed control with hot water under the name BioMant, continues to be innovative. The latest development is based on a successful collaboration with Abemec from the Netherlands, a dealer like for the French agricultural robots from Naïo Technologies.

Oz, the smallest robot from Naïo, but also larger robot-models, can now be equipped with a specially designed MANKAR ULV-spraying system. This pressureless ULV system efficiently and economically sprays conventional herbicides, mixtures, and biological herbicides. Different models exist, such as with one or two spray shields and different spray widths and these machines are ideal for weed control in row crops.

"Through deepening our cooperation with dealers and manufacturers of autonomous vehicles, MANKAR ULV-technology is making its way into the latest generation of 'Smart Farming Systems,'" says Hiske Weissmann, Managing Director of Mantis ULV-Sprühgeräte GmbH. "The ULV-spraying systems are perfectly suited for economical and targeted spraying of most liquid preparations, as much less product and hardly any water need to be transported compared to conventional spraying technology. The MANKAR-spraying systems are thus not only an ideal complement for robots but also for drones," Weissmann adds.

The Oz robot with ULV spraying kit can be seen at the Mantis ULV booth. In addition to the MANKAR ULV systems, the complete BioMant range of hot water devices for chemical-free weed control will also be represented.

Mantis thus offers a complete range of professional equipment for weed control, both for the use of biological agents and herbicides and hot water.

Mantis celebrates 50 years of innovation and sustainability

Since 1974, Mantis ULV-Sprühgeräte GmbH has been a pioneer in environmentally friendly spraying. From its first nozzle design to today's cutting-edge ULV- Spraying, Mantis has consistently set benchmarks in efficiency, innovation, and sustainability.

The company will present advancements in weed control, including robot and drone-mounted MANKAR-ULV sprayers for precise, low-volume spraying.

Mantis also sets standards in sustainability: BioMant devices offer chemical-free weed control using hot water. New innovations include BioMant-Flex machines with durable lithium-ion batteries and operation with HVO100 fuel, which reduces CO₂ emissions by up to 90 per cent.

With a focus on innovation and eco-friendly technologies, Mantis continues to lead the way, delivering efficient, sustainable spraying solutions for a greener future.

Bio PLUS+

Reiners GmbH is one of the four Bio PLUS+ partners. The cooperation of four family businesses, each with many years of experience in the production and marketing of soft fruit as well as pome and stone fruit, has won the TASPO Award 2024.

All areas of production, from sowing the rootstock to finishing and production to marketing, take place entirely in Germany. This ensures sustainability and quality. The sustainability aspects start with the selection of robust varieties and include the use of peat-reduced substrates and plant strengtheners instead of pesticides. The basis for this is the EU organic certification.

A click on the homepage www.bio-plus.info provide all the important specialist information that the consumer needs in the area of ??fruit trees, such as pollinator tables and pruning graphics.

Christmas Mouse® – the slightly different Christmas star

This variety has round bracts instead of pointed ones and it is particularly resilient. The unusual soft-looking shape of its leaves reminds of the ears of a mouse. Inspired by the Christmas poem "The Christmas Mouse" by German storyteller James Krüss, the variety name and a suitable marketing concept in a comic design came about, which should also intrigue the youngest target group.

Flowerbox

The trendsetting box which has a huge popularity all over the world, is now available in European florist supplies as well – the sophisticated decoration of interiors and the embodiment of the perfect gift now starts its conquering journey.

Flowerbox is versatile, elegant and affable. Each box is a work of art, where – thanks to the translucent surfaces – the flowers are visible from all sides. It can make any occasion unforgettable. It not only keeps the memories of the celebrations long, but also the freshness and beauty of the flowers placed in it, so it is a unique product for florists as well.

Thanks to the help elements in the box, the flowers can be placed easily and in a variety of ways, as well as they keep the original shape of the composition. Using this box you can assure long lasting freshness up to two weeks for the flowers, whether these are roses, tulips or ranunculus. It is also a product of great practicality: easy to transport, not fragile. It closes securely so even by moving or transporting the box the flowers in it cannot move and the water cannot run out.

Its unique look and exclusivity can be enhanced by the own stylish logo of the florists, so the Flowerbox also provides a special tool for self-promotion. This high quality product is foremost in Europe made in Hungary to supply the European market in a quick and creditable way.

PAT with new developments

The continuous development of the ERP software PAT brings many enhancements and adjustments for the users also for 2019. With the beginning of the migration to PAT-Enterprise, PAT is made future-proof to be able to use current and future technologies in the coming years. This is shown, for example in the improved possibilities of scanner use.

By networking different modules, PP-Area, the area planning of Plug-Plant, can be used without any additional effort. The evaluation of the areas can be updated here without having to collect additional data. The data maintenance in PAT is sufficient for this.

The web portal of Plug-Plant also retrieves its data from PAT. Thus, it is possible to provide information such as orders, delivery processes or availability, customer-specific on the Internet.

For the sales force, there is the new version of PATplus. Now the data can be processed by different suppliers. New orders can either be exported via e-mail as an excel sheet or for a fully automated import. Various customer requests have been integrated into new functions.

In combination with the mail program David and the financial accounting of GDI, Plug-Plant offers a package of coordinated programs including personal, direct support with specialists from the green sector.

SANANBIO is backed by the world's largest LED chip manufacturer

SANANBIO is backed by the world's largest LED chip manufacturer, Sanan Optoelectronics. The company does not only bring large-scale manufacturing capabilities, but also an R&D team capable of customizing and designing lighting to the specific customer or plant needs.

The easiest way to achieve effective agricultural lighting is to provide a spectrum of light that best replicates sunlight or by providing the necessary spectrums / color combinations for specific functions. Color combinations vary depending on region, time, temperature, plant, plant cycle, production targets and many other factors.

SANANBIO has all the basic colors needed for replicating sunlight and activating specific functions for agricultural lighting. For any part of the spectrum where additional colors need to be added to the spectrum or additional light functions are needed, there are different SANANBIO color LEDs available for customer selection and tuning.

Hibiscus syriacus B'TWIST® LAVENDER 'Mingravi4' cov

The flowering is different on several points compared to classic varieties: very numerous flowers, length of flowering effectively prolonging until the first frosts. But it is its colouring that makes the difference with this big bright red heart in the middle of a big tender lavender flower.

Consumers will love this easy, drought-resistant, vigorous and well-structured shrub with a spectacular abundance of summer blooms. In fact, the public voted this variety in the top 3 best varieties at the Euro-Trial on Hibiscus in 2019.

Very easy to plant: open field or pot, sun (partial shade possible), drought resistant, frost resistant (- 25 degrees).

WEEDELETE® - The mechanical weed control

Thanks to the WEEDELETE®, the removal of weeds in an ecologically responsible way is within reach. The hoeing machine is equipped with well-defined technical applications which make the WEEDELETE® unique in its kind.

To weed the weeds, the hoes rotate through the top soil layer in the black strips. This is done in an ingenious way, so that weeding does not damage the crops. The hoeing machine is ground-following and levelling and has a good working speed. For optimal results, the depth control and working width can be adjusted steplessly. It also takes obstacles and drip hoses into account.

Due to the shallow tillage, the soil remains solid in structure. This provides extra stability and is ideal when you want to drive a machine over the weeded ground layer.

The WEEDELETE® could easily be attached to a tractor. The machine functions optimally at low engine power.

For use in nurseries but also with conifers, shrubs, bushes, multi-stemmed trees, and more. ([VIDEO](#))

WEEDELETE® RS hoeing machine ([VIDEO](#))

This intra-row weeder hoes both - between and in the rows of the trees. Available in various working widths.

WEEDELETE® ZRS Hoeing machine ([VIDEO](#))

This intra-row weeder is meant to hoe blackstrips in tree nurseries, while sparing the grass strips in the paths. Available in various versions: hydraulically adjustable, manually adjustable and fixed.

The new Robin Hood yew tree

Helmers Baumschulen GmbH is presenting the new Robin Hood yew tree. This special yew tree emerged as a wild seedling in northern Germany in the 1980s, in the Halsbek part of the Helmers tree nursery. Its habit is upright and columnar, but it grows very slowly. The needles are deep dark green and show an attractive fresh green color play when they shoot.

As a natural selection of the native European yew, the Robin Hood variety impresses with its very high robustness and healthy, vital growth.

The sale is supported by an attractive brand label with a bow and arrow logo, symbolizing the connection to the yew as a traditional wood for longbows. According to legend, the longbow of the legendary figure Robin Hood was made from yew wood, which explains the inspiration for the name of the yew tree *Taxus baccata* Robin Hood.

The Robin Hood yew tree offers a wide range of possible uses: when grown alone, it impresses with its small space requirements and remains attractive for many decades. It is ideal for elegant front gardens as well as for high-quality grave plantings, even on small urn graves.

The Robin Hood yew is also an excellent choice as an exclusive border hedge. What is particularly noteworthy is the minimal maintenance effort: it is usually sufficient to slightly shorten the top shoots once a year. No further pruning is necessary due to the natural, upright, compact growth.

'Wisebear'® – the CO2 climate-friendly bamboo

In general, bamboo is one of the most climate-friendly plants on earth. It can absorb up to 500 tons of CO2 per hectare from the air over a period of ten years. This is reason enough for us to launch a new concept this year: 'Wisebear'® - the climate-friendly bamboo, which also looks great.

Compared to other bamboo varieties, the 'Wisebear'® is able to use its withering leaves as its own source of nutrients and thus forms its own cycle. In addition to its extremely healthy growth, it is very hardy and is suitable for planting in hedges, as a solitary plant or in a bucket. Also visually the 'Wisebear'® clearly stands out from other common varieties with its dark, closely spaced culms. Its strong root development in the center of the plant quickly leads to many new shoots. The 'Wisebear'® grows quickly and quickly develops into an imposing plant without root runners. It grows best in moist, nutrient-rich soil in sun or partial shade.

The new bamboo is available in a blue 5-litre pot and a plug-in label showing the climate-friendly technical information. It integrates wonderfully into the overall topic of climate protection and sustainability. Every customer can easily reduce their own carbon footprint with the 'Wisebear'®.

Ambella® Intense White

This season, Addenda® introduce a true innovation in the Campanula range: the Ambella® Intense White. This pure white Campanula Portenschlagiana combines a pure, bright colour with impressive properties.

- | Pure and bright white colour
- | Colourfast - remains brilliantly white, even in cold temperatures
- | Longer flowering pleasure - enjoy rich blooms for longer
- | More sustainably grown - less energy due to colder growing conditions

With its compact growth, rich flowering and long shelf life, the Intense White is the must-have for every garden centre and every consumer. The Ambella® Intense White is available in pot sizes 10.5 and 12 centimetre.

Biodegradable plant pots

Bioplasmar specializes in the production of biodegradable plant pots using regional green waste as raw materials.

The new pot has a diameter of twelve centimetre and a volume of 0.72 liters (including pot) and is suitable for automated systems and potting machines, as well as for all types of irrigation. It is also mold-free and storage-stable.

Once the pot has been placed in the soil, it begins to decompose, providing the plant with the nutrients it produces. This promotes plant growth.

Cultivating plants in Bioplasmar pots saves time and resources and provides the plant and the soil with important nutrients.

New within the Floragard group

In future, the newly founded Re-Peat Agrar GmbH will focus on securing cultivation areas for regionally renewable raw materials for soils and substrates. Meanwhile, research into the refinement and use of these raw materials will continue to be the responsibility of Floragard Vertriebs-GmbH's specialized horticulture department.

Florian Moser is currently looking for farmers who are interested in growing *Miscanthus x giganteus* in the north-west of Germany in the long term. It is a fast-growing raw material for ecologically high-quality biomass production and is an important raw material supplier for peat substitutes, especially from Floragard's perspective.

"I am looking forward to taking on the challenges in the market with regard to increasing the quantities of peat alternatives in potting soils and horticultural substrates and making a decisive contribution to the success of Floragard Vertriebs-GmbH. The quality and availability of the raw materials will continue to determine Floragard's status as a reliable substrate and soil supplier in the coming years", says the new Re-Peat Agrar Managing Director Florian Moser.

Helleborus ViV® Diana

Early lemonniera variety, unique in the market: Flowers go from soft pink to dark pink as temperatures drop. Older flowers also retain their pink colour and add ornamental value to the plant. Long flowering time.

The botanical, open flower shape fits well into several garden styles. The richly filled flowers provide a feast for the early bees. In the garden, ViV® Diana produces more flowers year after year but no unwanted spread. And even in snow and frost she steals the show with her brilliant pink colours.

Lady ViV® Diana lives up to her name: Modest as a crown princess, she inclines from soft pink to warmer pink as it gets colder. But she is never average. In fact she's a little eccentric. With her open flower shape, she stands out from other varieties. She is radiant, yet with a hint of mystery. Well worth discovering.

RootBarrier® RollRib®

The RootBarrier® RollRib® is an innovative root guidance system on a roll and is made of 1.5 millimetre high density polyethylene (HDPE). The RollRib® has integrated vertical guidance ribs and is 100 per cent recyclable. This system is easy and faster to install than alternative products due to the different lengths of 21 and 75 meters.

In addition, the RollRib® is easy to cut to the desired length thanks to the cutting line that is on every meter of the roll. With this system roots are guided carefully downwards. Because it has guidance ribs every 18 centimetre, it can be placed either in a line, in a square or in a circle surrounding the tree. The RootBarrier® RollRib® has integrated soil anchors, which prevent the tree roots from pushing the RollRib® up. Sections of RollRib® are easily and quickly joined by means of the enclosed screws.

Innovations for steaming

Inefficiencies and progressive resistance with weeds and diseases as well as prohibitions and restrictions for herbicides are drawing increasing attention to steaming. Steaming methods can be used in all sectors of horticulture – both in the greenhouse and on open land. The steam boilers from MSD are the only ones in the field of steaming to meet the high safety standards pursuant to the directive 2014/68/EU with the CE mark, the Federal Emission Control Act and the Industrial Safety Ordinance.

When applied in horticulture, the modern, time-saving and energy-efficient cover steaming process is prevailing at an increasing rate. On open land, semi- and fully automatic steamers are already being used successfully on large areas, especially in vegetable and forest nurseries. A technical development is the use of spiked covers for so-called sandwich steaming. In this case, steam is applied by means of 17 centimetre long spikes to a depth of around 25 centimetre. Initial experience resulted in energy saving of 50 per cent over conventional cover steaming.

Steaming also has a good effect on combating weeds, soil-borne diseases and pests as well as soil fatigue for strawberries.

For this purpose, MSD has developed a dam steaming device which steams dams laid with mulch film and, at the same time, pierces the planting holes.

Sansevieria laurentii

Sansevieria is commonly known as snake plant or mother in-law's tongue.

As houseplants, *Sansevieria* thrive on warmth and bright light, but will also tolerate shade. They can rot from over-watering, so it is important that they are potted in well-drained soil, and not over-watered. They need to be re-potted or split at the root from time to time because they will sometimes grow so large that they break the pot they are growing in.

It is one of the best plants for clean indoor air. Easy to care for.

Sundaville® Blue

The new Sundaville® Blue, also known as Bluephoria, marks a groundbreaking achievement in ornamental horticulture. This Mandevilla or Dipladenia is the world's first 'blue' variety, setting a new standard in both breeding and marketing. Often referred to as 'Mandevilla 4.0', it represents the next evolution in this popular plant' development.

Sundaville® Blue features a classic growth habit with exceptional branching and robust structure. Its striking blue-purple hue makes it stand out, and it thrives in almost every climate. Whether on the terrace, balcony or containers, this Mandevilla shines.

Iteristic is its progressive changes from pink buds into vibrant and eye-catching big purple flowers.

Thom - Metal outdoor

Meet Thom. A showpiece from the metal range of TS Collection. The Dutch brand has these eye-catchers of metal made by experienced craftsmen.

Thom is an enamelled pot. The basis consists of natural metal which is then provided with a shiny top layer of ceramic. Thom combines the best of two worlds. The lightweight, unbreakable of metal with the maintenance-free character of ceramic. The result is an exceptional appearance. Chic and daring at the same time.

The Thom series consists of XL pots that are ideal for outdoor living spaces such as canopies and conservatories. Metal is a natural product that may oxidize.

Carry Packs

The plastic plant packaging ensures that your plants are displayed at their very best in the shop. Even when the plants are packed in plastic, the transparent material and high-quality packaging ensure that they are displayed in a way that does justice to the appearance of the plants themselves.

Carrypacks

Voges Verpakking has developed a carrypack design for large plants, allowing you to deliver the plant complete with its pot. This is ideal for cacti in particular, as it is a way for you to protect customers and other items in the trolley from the sharp spines of the cactus. These types of plant packaging also allow you to make combinations, you could package three different cacti together, for example.

Graptopoveria Starfire

Sustainable innovation: Italian terracotta, highly valued across Europe, takes center stage in the Terra collection. Hand-decorated pots ensure the perfect environment for succulents, both outdoors in summer and indoors during winter. Not just ordinary pots, but modern, functional designs, like the [Graptopoveria Starfire](#). Following the success of Mangave Praying Hands, awarded first place at last year's IPM, Annarita Manera collaborated with Plantipp and Spanish hybridizer Succulentia to introduce this stunning new variety. Its leaves, flower petals, and rosette create a vibrant "flame" of colour.

[Cactusmania by Manera](#) is pleased to announce the arrival of unique specimens and exclusive compositions, combining design, biodiversity, and botanical allure. Once again, Annarita Manera, leveraging her extensive experience, is ready to amaze. By interpreting the needs of customers and gathering insights from retailers, practical and innovative solutions have been crafted. Drawing inspiration from the past while anticipating the future, the 2025 collection reflects emerging European trends in the world of succulents and cacti.

Rare plants and mutations: There is a growing demand for unique varieties, such as monstrous or crested cacti. To meet this need, the assortment now includes exceptional plants like the striking *Lophocereus scotti* cv *Mostruoso*, a monstrous columnar cactus perfect for true collectors, and *Opuntia engelmannii* cv. *Boskowitz*, an ornamental prickly pear cactus with soft, pure white spines that make a bold visual statement.

Benchmarking 4.0

The benchmarking portal "Betriebsvergleich 4.0" is now available to all horticultural enterprises in Germany. With little effort you can avail of a routine check-up for your enterprise that reveals need for action and highlights where economic potential is not yet fully exploited.

You can also use the results from the benchmarking portal for communicating and setting goals for your staff. In addition you can show economic competence and your eagerness to develop the economic performance of your farm during loan acquisition.

The complete functionality of the benchmarking portal can be used anonymously, if you apply for an access token through the official extension service or your tax advisor. Using the portal is possible also independently by registering yourself. In any case, the use of the benchmarking portal is free of charge.

The portal is accessible at <https://benchmarking.zbg.uni-hannover.de> (in German only). Please check out the given example assessment reports for the different horticultural branches even without registration. The cockpit view gives an overview of evaluation results in terms of the four most relevant dimensions:

- | profitability in the current year
- | profitability in the past year
- | liquidity and
- | personal drawings.

Further gauges show productivity indicators in terms of labour, land and operating profit margin relative to the benchmark farm data from the network.

Long Life Cut Flower Food

Maximize the potential of your flowers with Long Life: Long Life Cut Flower Food has been proven to keep flowers fresh for longer.

Developed in Israel decades ago and widely used by Israeli growers as well as by the leading global flower growers in the main flower exporting countries (Colombia, Ecuador, Kenya and more) - Long life cut flower food provides all the necessary ingredients for your flowers to maintain its quality and bloom for longer.

Available in sachets to be attached to a flower bouquet as well as in buckets and liquid formulation for use by wholesalers, retailers, florists and consumers at home.

Gadot Agro is a leading Israeli Agro Tech company, providing since 1950 full agro solutions to growers and customers around the world. The proprietary line of Post-Harvest Solutions for cut flowers consists of the T.O.G family of products enabling growers to keep their flowers fresh and beautiful during production achieving the highest output even under the toughest conditions all along the floricultural chain. LONG LIFE brand of products ensures flowers remain fresh and long lasting as they reach their final destination for the utmost consumer satisfaction.

HM.CLAUSE 2020 Novelties

Cherry tomato CROKINI: tasty, sweet, easy to grow and strong against late blight disease (IR: Phytophthora infestans. An average of 8.5° Brix, more than 317 sweet delicious little fruits, strong fine quality plant, fruits do not split at maturity and remain on the plant.)

Cherry tomato GOLDWIN: sweet taste, good balance between sugar and acidity

Cherry tomato HONEY MOON: sweet taste, good balance between sugar and acidity

Tomato BUFFALOSUN: yellow fruit «red flamed», fleshy chair, perfect to colour salads, huge fruits up to 750 gram

Tomato FLORINRED: Excellent resistance (IR) to late blight

Tomato BELLANDINE: Fleshy, delicious and productive; very good behaviour against blossom end rot

Cherry tomato CRAZY CHERRY: No care requirement, plant, water and harvest; produces many small sweet and fleshy tomatoes

Courgette BOLDENICE: Powdery mildew resistance with an upright plant habit; high productivity due to short internodes, produces striped green fruits

Jalapeno ORIZABA: Hot Mexican pepper, spicy and flavoursome for thrill-seekers

Orange bell pepper ETERNITY: colours for garden and dishes

Well adapted to the garden and to pots

Mini red pepper BALCONI: Colours and flavours for terraces, balconies and small garden. Compact plant ideal for pots or small gardens, high productivity, small red sweet fruits, row or cooke.

Novelties in heirloom type (yellow fleshy variety, pink one and more).

Collection of cucumbers, watermelons, peppers and more.

HM.CLAUSE breeds, produces and sells innovative vegetable seeds for professionals and the home garden market. A French company, it has been a major player in varietal breeding for the vegetable garden for more than two centuries. CLAUSE Home Garden is exclusively dedicated to promoting varieties for home gardeners: sales of vegetable seeds and flowers to packet seed producers and sales of vegetable seeds to professional young plant producers for gardeners.

LED horticultural lighting

Engel Lighting produces horticultural LED lighting and shows how LED lighting strategies can maximize profits, increase yields and specifically control desired plant morphology.

The key to the success of an LED lighting strategy is to change limiting abiotic factors through a new balance.

With LED lighting, the plant can not only be illuminated vertically, but also horizontally and closer because less heat is generated. As a result, greenhouses can be built lower and also illuminated in summer. Many plants grow better in fully controlled environments without daylight because they are less exposed to stress and pathogens and when planted in rock wool or foam they have better access to nutrients and water.

More plants can be cultivated in a smaller area, whereby the costs for air conditioning are reduced and lower operating costs are achieved through a significantly longer lifespan. Standardization measures at all stages of production are fundamental to production. The ability to measure and control all environmental factors in climate-controlled plant cultivation areas makes it possible to control the cultivation conditions completely independently of the climate of the location and to generate optimal growth conditions and thus harvest more crops each year.

Engel Lighting offers professional LED garden lights with uniform light distribution, quiet in operation and reliable for many years. Individually or in series for use on shelves (vertical farming) and on growing tables.

GreenPlan

Manage your production planning and economic forecast: GreenPlan is a planning software designed for pot plant growers.

GreenPlan is highly focused on precise timing of sale and has a number of features making it easy to assure that the right mix of varieties and colours will be available in due time; it makes it immediately visible for the planner, whether a production is candidate for up scaling or down scaling.

- | Forecast earning at crop level
- | Plan after your peak sales
- | Planning on day or week level
- | Overview of production and consumption of cuttings
- | Multiple cultivation recipes per variety
- | Graphical plan over your space consumption
- | Calculate the culture's consumption of heat, electricity, CO2 and growth light
- | Price calculator for Added Value

Benefits for the user:

- Easy use
- Easy look at planning alternatives
- Production plan and budget in the same process
- Quick overview of profit, costs or hours consumption
- Quick presentations to colleges on screen or handouts

Pentacil: The plant vitalizer

Pentacil® is a water dispersible plant vitalizer, which increases vitality and strengthens the plant's immune system. The product contains five highly potent *Bacillus* species that naturally strengthen the plants: *Bacillus amyloliquefaciens*, *B. licheniformis*, *B. pumilus*, *B. simplex* and *B. subtilis*. Pentacil® is suitable for soil and foliar applications.

Bacillus spores are more resistant to adverse environmental conditions than the spores (conidia) of *Trichoderma* fungi. This is especially true for the conditions on the leaf surface where they are exposed to dryness and UV radiation. Therefore, Pentacil® is a useful supplement to *Trichoderma* products, such as Bactiva®, especially when application is difficult and when the microorganisms encounter challenging living conditions.

Flowerbox

The trendsetting box which has a huge popularity all over the world, is now available in European florist supplies as well – the sophisticated decoration of interiors and the embodiment of the perfect gift now starts its conquering journey.

Flowerbox is versatile, elegant and affable. Each box is a work of art, where – thanks to the translucent surfaces – the flowers are visible from all sides. It can make any occasion unforgettable. It not only keeps the memories of the celebrations long, but also the freshness and beauty of the flowers placed in it, so it is a unique product for florists as well.

Thanks to the help elements in the box, the flowers can be placed easily and in a variety of ways, as well as they keep the original shape of the composition. Using this box you can assure long lasting freshness up to two weeks for the flowers, whether these are roses, tulips or ranunculus. It is also a product of great practicality: easy to transport, not fragile. It closes securely so even by moving or transporting the box the flowers in it cannot move and the water cannot run out.

Its unique look and exclusivity can be enhanced by the own stylish logo of the florists, so the Flowerbox also provides a special tool for self-promotion. This high quality product is foremost in Europe made in Hungary to supply the European market in a quick and creditable way.

Eracle and Supereracle pots

Eracle, the pot that makes the roots of your plants laugh. The non rooting-circling function and the "feet" that space the bottom of the pot from the ground, guarantee a perfect combination of air and water for an optimal growth of the roots.

After the success achieved with the cultivation in Eracle pots, the research and development department designed Super Eracle. The Super eracle pot is even more performing thanks to the better ventilation given by the many openings on the bottom and the feet that distance it from the ground. In this way, the root system "breathes" and the plant grows stronger and healthier.

PAT with new developments

The continuous development of the ERP software PAT brings many enhancements and adjustments for the users also for 2019. With the beginning of the migration to PAT-Enterprise, PAT is made future-proof to be able to use current and future technologies in the coming years. This is shown, for example in the improved possibilities of scanner use.

By networking different modules, PP-Area, the area planning of Plug-Plant, can be used without any additional effort. The evaluation of the areas can be updated here without having to collect additional data. The data maintenance in PAT is sufficient for this.

The web portal of Plug-Plant also retrieves its data from PAT. Thus, it is possible to provide information such as orders, delivery processes or availability, customer-specific on the Internet.

For the sales force, there is the new version of PATplus. Now the data can be processed by different suppliers. New orders can either be exported via e-mail as an excel sheet or for a fully automated import. Various customer requests have been integrated into new functions.

In combination with the mail program David and the financial accounting of GDI, Plug-Plant offers a package of coordinated programs including personal, direct support with specialists from the green sector.

A new Taxus: The Media Rising Star

Taxus media Rising Star: a new Taxus with dense and uniform growth. With a perfect shape that doesn't require pruning. Easy and good-looking: a perfect combination, isn't it? That's exactly what tree nursery De Buurte thought when they saw this Taxus stand out amongst many others. They called him Rising Star because of its excellent upright growth. You will also like this shrub for its fine shape of its dark green leaves.

It is a male plant, so you won't be bothered by (poisonous) berries. Rising Star grows to two metre high and 60 centimetre wide. Plant Rising Star in sun or partial shade. It thrives in humus-rich (garden peat) and moist soil. It survives winters up to minus 25 degrees. Rising Star is easy to propagate and grows faster than other varieties like 'Hicksii' en 'Hilli'. Very suitable as solitary, high or low hedge and for landscaping. It is the ideal Taxus for every garden.

Key Points

1. Uniform growth
2. Fine leaves
3. Upright, bushy habit
4. No berries

SANANBIO is backed by the world's largest LED chip manufacturer

SANANBIO is backed by the world's largest LED chip manufacturer, Sanan Optoelectronics. The company does not only bring large-scale manufacturing capabilities, but also an R&D team capable of customizing and designing lighting to the specific customer or plant needs.

The easiest way to achieve effective agricultural lighting is to provide a spectrum of light that best replicates sunlight or by providing the necessary spectrums / color combinations for specific functions. Color combinations vary depending on region, time, temperature, plant, plant cycle, production targets and many other factors.

SANANBIO has all the basic colors needed for replicating sunlight and activating specific functions for agricultural lighting. For any part of the spectrum where additional colors need to be added to the spectrum or additional light functions are needed, there are different SANANBIO color LEDs available for customer selection and tuning.

The Milkshake™ Mums

The new Milkshake™ Mums have striking colours, a compact growing habit and are a true family. Their names refer to fruity milkshake flavours: Coconut, Banana, Papaya, Cherry, Strawberry and Raspberry.

Because all the different Milkshakes™ are colour mutations all colours have a similar growth cycle with uniform plants that bloom simultaneously. They need little or no growth regulation and have a response time of about six weeks, this makes growing these beauties even more attractive.

Besides these great family characteristics, their compact shape makes it possible to save on transportation costs. Royal Van Zanten recommend to grow Milkshake™ into pot sizes up to 14 to 15 centimetre. Milkshake™ Mums are very flexible and are therefore easy to handle and pack.

Not only growers are enthusiastic about this new concept. Milkshake™ also has great features for retailers, such as a great shelf-life and a beautiful and equal blooming experience for the consumer.

All-in-all the new Milkshake™ family is THE new compact multiflora family.

SISSI STRAWBERRY - the world's first strawberry tree

SISSI STRAWBERRY is a vertical planting system specially designed for planting strawberries on the balcony, terrace or in the garden.

SISSI STRAWBERRY has a modular design and is available in four different versions – the right version for every location. The cultivation of healthy strawberries makes fun and is simple: The clever product design simplifies planting, watering and harvesting.

Last year PAUL POTATO, the world's first professional potato tower, was the highlight of the fair. This year his little sister SISSI STRAWBERRY will be in focus.

Lavandula 'Meerlo' for the modern garden

Lavandula 'Meerlo' is a colourful lavender with beautifully serrated, grey-green leaves with a cream-colored margin. The light blue flowers have a sweet fragrance. 'Meerlo' becomes about 90 centimetre high and 120 centimetre wide and is very suitable for the perennial border or rock garden, for mass planting or for a pot on terrace or balcony.

This lavender is very drought, humidity and heat tolerant and fits perfectly in the modern garden. Plant 'Meerlo' in the full sun to semi-shade in a well-drained soil. Prune after flowering. 'Meerlo' is hardy to approximately minus nine degree.

RootBarrier® RollRib®

The RootBarrier® RollRib® is an innovative root guidance system on a roll and is made of 1.5 millimetre high density polyethylene (HDPE). The RollRib® has integrated vertical guidance ribs and is 100 per cent recyclable. This system is easy and faster to install than alternative products due to the different lengths of 21 and 75 meters.

In addition, the RollRib® is easy to cut to the desired length thanks to the cutting line that is on every meter of the roll. With this system roots are guided carefully downwards. Because it has guidance ribs every 18 centimetre, it can be placed either in a line, in a square or in a circle surrounding the tree. The RootBarrier® RollRib® has integrated soil anchors, which prevent the tree roots from pushing the RollRib® up. Sections of RollRib® are easily and quickly joined by means of the enclosed screws.

Innovations for steaming

Inefficiencies and progressive resistance with weeds and diseases as well as prohibitions and restrictions for herbicides are drawing increasing attention to steaming. Steaming methods can be used in all sectors of horticulture – both in the greenhouse and on open land. The steam boilers from MSD are the only ones in the field of steaming to meet the high safety standards pursuant to the directive 2014/68/EU with the CE mark, the Federal Emission Control Act and the Industrial Safety Ordinance.

When applied in horticulture, the modern, time-saving and energy-efficient cover steaming process is prevailing at an increasing rate. On open land, semi- and fully automatic steamers are already being used successfully on large areas, especially in vegetable and forest nurseries. A technical development is the use of spiked covers for so-called sandwich steaming. In this case, steam is applied by means of 17 centimetre long spikes to a depth of around 25 centimetre. Initial experience resulted in energy saving of 50 per cent over conventional cover steaming.

Steaming also has a good effect on combating weeds, soil-borne diseases and pests as well as soil fatigue for strawberries.

For this purpose, MSD has developed a dam steaming device which steams dams laid with mulch film and, at the same time, pierces the planting holes.

Sansevieria laurentii

Sansevieria is commonly known as snake plant or mother in-law's tongue.

As houseplants, *Sansevieria* thrive on warmth and bright light, but will also tolerate shade. They can rot from over-watering, so it is important that they are potted in well-drained soil, and not over-watered. They need to be re-potted or split at the root from time to time because they will sometimes grow so large that they break the pot they are growing in.

It is one of the best plants for clean indoor air. Easy to care for.

Revolutionary biobased and biodegradable stake that feeds the plant

Voodstoc introduces a plant label display stake that feeds the plant. In collaboration with the University of Wageningen and Rodenburg Biopolymers they developed this particular stake. During a period of ten weeks it gradually releases the food to the plant.

Voodstoc is not only bio based, but also biodegradable. It fits perfectly in the new way of thinking about the circular economy. Offering a sustainable alternative for fossil fuels, the company uses starch obtained from waste from the potato industry. The raw material for Voodstoc is already in the circular production circle. An excellent alternative to the wooden stakes, which deprives new wood to nature.

COIR PITH - a growing media for Agri/Horticulture Applications

Coir pith, the by-product of dehusking of coconut fibre, is the spongy material that binds the coconut fibre in the coconut husk. As an excellent soil conditioner, it now finds varied uses as a good manure and in horticultural applications as a soil-less growing medium. Coir pith is a substitute for peat moss which is widely in use in European countries and is made available in various forms like organic manure, grow bags, briquettes, discs and more of different sizes.

Let's get glossy - highgloss for every room

The new Glossy collection from LECHUZA brings a hint of glamour to the living room. The planters with high-quality varnished surfaces give rooms an elegant feel. The trendsetting pieces do not only look sophisticated, but also impress with their integrated irrigation system, giving plants access to a reliable water supply. The new Glossy planters are the must-haves of the season.

Following a high-gloss makeover, the popular LECHUZA planter CUBE now comes in three additional brilliant high-gloss shades. The high-gloss surface forms a modern contrast to green houseplants or delicate flowers, making CUBE Glossy a real eye-catcher. The larger CUBE Glossy Triple offers a lot of space for flowers, herbs or smaller shrubs and serves as a sophisticated highlight that will give any living space a glossy feel. With its elongated shape, the new planter can be an impressive herb garden on the windowsill, a garden for succulents on the living room shelf or an unusual flowering decoration on the table.

With the Green Wall Home Kit Glossy by LECHUZA, a well maintained, hanging garden that gives a new perspective on green and flowering plants can be created in no time at all. If you don't have much space or simply enjoy unusual plant designs, you can now bring a touch of nature to your very own wall. As classic wall greenery, as creative holders for make-up tools in the bathroom or as pencil box in the children's bedroom – the Green Wall Home Kit Glossy is a true all-rounder and highly versatile.

To make sure that caring for your plants doesn't get too stressful, the LECHUZA irrigation system will look after the water supply for your green flatmates. The plants can be placed in the planter in their pots, eliminating the need for time-consuming repotting. A wick, which is placed in the pot from below, transports moisture to the roots. This is how easy it can be to take care of your plants.

Malus 'Royal Raindrops®' exclusive by Ley

Eye-popping magenta pink blooms, deep purple cutleaf foliage, sparkling red fruits and bright fall color give all-season appeal to this easy-care flowering ornamental. Superior disease resistance, adaptability, plus heat and drought tolerance make this unique crabapple a crown jewel among trees.

Refined, uniquely shaped leaves emerge glossy deep purple and maintain their rich color through the heat of summer. Fall color is a madly of bronze, orange and purple. Tiny persistent, bright red fruits appearing in late summer are prized by wildlife and add winter interest. Strong branch angles and upright growth habit minimize the pruning and shaping needed to develop a balanced canopy. More vigorous than other purple-leaved cultivars, 'Royal Raindrops®' Crabapple quickly gains caliper while developing a sturdy, well-tapered trunk.

Vertical Gardens - Roof Gardens

Vertigan presents a range of innovative developments in vertical gardens - "Indoor" at home, in the working place, in the office. Can be combined with hydroponic system and "Outdoor" to cover concrete walls, house facades, fences, concrete pillars, bridges and public buildings.

All products are equipped with automatic irrigation systems.

For roof gardens Vertigan has developed a smart system to cover the roof in a green garden where you can grow flowers, grass, green vegetation, organic vegetables and even ornamental trees or fruits.

The system allows to make any flat roof of the parking lots or any unused flat roof into a beautiful garden. All with a do-it-yourself system and like the vertical gardens, equipped with automatic irrigation systems.

All systems have no direct contact with the building walls or floors, so no moss is formed, which harms the building.

Vertical landscaping and roofs gardens add an additional layer of thermal insulation to existing insulation systems.

The innovations focus on very easy assembly, easy maintenance, water saving, fertilizer savings, and ultimately very important, low prices. All products can be set without professional help.

Thanks to the modular system, you can start with a small base unit and expand it to a very big magnificent garden. All extension units matched together as Lego game bricks.

Another development is "mobile vertical gardens". They serve as mobile green partitions in banquet halls, hotel lobbies, wedding festive events background, fairs and exhibition pavillons.

All facilities are decorated with live plants and equipped with automatic irrigation. Replacing the plants to change the design takes only a few minutes. The systems are equipped with quiet and hidden wheels so they can be moved easily.

Livium, a real work of art

Livium is a symbol for the 'next generation' in Anthuriums. The natural veins give a beautiful look and feel to the variety. This novelty really has the X-factor. Anthura is proud of this beautiful breeding result, which is likely to lead to a completely new line of pot Anthuriums in the future. The natural outlines and patterns on the spadix are particularly beautiful and give it a really special appearance.

The plant is suitable for pot sizes 14 and 17 centimetre. The flowers are medium in size and the predominant colour is red with clear white coloured veins in the flower. The shelf life of the plant is good to excellent.

Very smart: Artificial Intelligence in horticulture

As a new module in the **g-pda.®** family, JayVee Green Consult Jens Varnskühler presents the new **g-pda.®PlantDoctor**: using AI (Artificial Intelligence) and ML (Machine Learning) to increase your efficiency the smart way.

When checking your cultures just take a photo of a symptomatic leaf or a pest with your smartphone and the **g-pda.®PlantDoctor** immediately tells you which disease it is. Now scan the QR code of the affected stock and the **g-pda.®PlantDoctor** will suggest a treatment. In doing so, the already applied agents, incompatibilities and legal regulations are automatically taken into account.

In the next step, **g-pda.®PlantDoctor** checks the current inventory of the selected agent, calculates the area to be treated, the tank recipe and creates a task that you can assign directly to an employee.

Hybrid lighting solution for professional greenhouses

BLV is one of the very few providers in the market that offers a complete range of assimilation lighting: From lamps and power supplies to complete luminaires and from HPS or MH to LED, all from one source and perfectly synchronised with each other.

BLV introduces a hybrid solution: the well established, efficient and reliable HPS lights in combination with high performance LED interlighting. This hybrid solution is designed for greenhouses with high wire crops that aim for the best standards.

The HPS luminaires are equipped with a lamp and power supply produced in BLV's factories in Europe. The compact and solid design provides best-in-class PAR values and spectra for optimum plant growth. Safety, reliability, efficiency and durability are guaranteed. The open reflector allows an easy heat dissipation that increases the lifetime of the lamp. This can be translated directly into a reduction of maintenance and replacement costs.

The LED interlighting luminaires are available in different spectra, adapted to the needs of your crop! The passively cooled luminaire has been designed to optimise efficiency, light homogeneity and light absorption by the plants. The anodised aluminium housing is non-corrosive and classified with an ingress protection of IP66. Installation in a continuous line along the rows of plants is made easy thanks to feed-through wiring.

Hortiviv – Enriched substrates of the future

In the past few years there has been a large development for the selection of beneficial organism capable of enforcing plant growth. Through creating natural symbiosis with plant roots, several of these organisms have shown to improve the resilience of plants. Greenyard Horticulture developed an innovative technology to bring these benevolent microorganisms to life, so they have a direct action at the plant roots.

Hortiviv® is a substrate inoculated with fungi, directly settled in the substrate in their living form. For two consecutive years, the University of Ghent and ILVO (Flemish institute for agriculture) used this inoculated substrate to conduct experiments during strawberry cultivation. These experiments showed that strawberries grown on the inoculated Hortiviv® substrate are more resistant to decay and improving thus significantly the shelf-life.

In addition, Hortiviv® can also be used for root sensitive tree cultivations, where it also has the ability to stimulate the plant growth and root vigor. Hortiviv® is allowed on the Belgian market for use in substrates (Derogation EM736.E).

PLA Sleeves

You see and hear it everywhere: horticulture also needs to become more sustainable. That is why Koen Pack has added some 100 per cent biodegradable sleeves to its standard range. These sleeves are made of a durable and naturally degradable material. They are printed with water-based ink which is better for the environment.

What are the advantages of PLA (Poly Lactic Acid)?

This material is not made of fossile fuels, in contrast to traditional plastics. These sleeves are made from renewable sources like sugar cane and corn. Because these sleeves are biodegradable, they can be composted after use. The consumer can simply throw the sleeves into the green waste bin together with the leaves. It is 100 per cent industrially compostable.

TROLLEY M2

The UNI-TROLL Trolley M2 is designed to carry two 600 x 400 millimetre ISO modular boxes or plastic crates per shelf level.

Underneath, two swivel and two fixed Ø125 millimetre castors ensure easy maneuverability, and the strong and durable 40 millimetre PUR tread ensures noise-reduced rolling. Eight post profiles and four post extenders can be placed safely in the trolley base frame. This protects the posts from being damaged and makes them easy to handle.

A Trolley M2 frame can also be placed on the top of the posts and you can take advantage of having a double-layer trolley load for the full truck height on long-distance transportations. Trolley base frames can be stacked on top of each other to reduce cost when empty trolleys are returned.

Measures and capacity

The Trolley M2 base frame is 891 x 616 millimetre and the height from ground level is 270 millimetre. The inside length is 815 millimetre.

Its unloaded weight with posts is 47 kilogram (base frame 25 and posts in total 22 kilogram). The trolley's carrying capacity is 400 kilogram SWL (Safe Working Load).

When stacked on top of each other, the stacking height of the first layer is 270 millimetre. When stored empty, twelve base frames can be stacked on top of each other to reach a height of 2580 millimetre.

Shelves

Trolley M2 shelves are available in three different variations:

The Shelf M2 PPGF is a plastic version that carries 40 kilogram UDL (Uniform Distributed Load) and is stackable to reduce the volume when returned empty. Its unloaded weight is 4.7 kilogram. The material is impact-resistant and in a new design with shock-absorbing high-tensile steel rods.

The Shelf M2 PWS is the plywood stackable shelf version, which can carry 60 kilogram UDL. Its unloaded weight is 3.9 kilogram.

The Shelf M2 PW is the plywood non-stackable shelf version, which can carry 60 kilogram UDL and is placed in the posts when returned empty. Its unloaded weight is 3.7 kilogram.

Happy with Calla

Elegant shapes, clean lines – Calla offers ample inspiration for a mindful moment in the madness of modern times and offers nothing but flowering, empowering happiness. The excellent reputation of this flower goes back to the Romans and Greeks in ancient times, who saw in Calla a gorgeous symbolic chalice for toasting to life.

Life is good

Calla is still seen as the bringer of happiness. It is a symbol for finding comfort and joy in small things: a fresh cup of coffee, a nice gesture, a sunny day, exchanging a smile with a passing stranger and all other things that make life a bit more beautiful every day.

Colour your day with Calla

The good vibes of Calla become even stronger when you add the magnificent colours of this flower. Red for love, pink for new beginnings, orange, yellow and green for joy, purple and black for a bit of drama and white for serenity and pureness. There are even bicolour callas, just in case it is impossible to choose. Lovely to get and amazing to give: there's nothing like sharing happiness.

Benchmarking 4.0

The benchmarking portal "Betriebsvergleich 4.0" is now available to all horticultural enterprises in Germany. With little effort you can avail of a routine check-up for your enterprise that reveals need for action and highlights where economic potential is not yet fully exploited.

You can also use the results from the benchmarking portal for communicating and setting goals for your staff. In addition you can show economic competence and your eagerness to develop the economic performance of your farm during loan acquisition.

The complete functionality of the benchmarking portal can be used anonymously, if you apply for an access token through the official extension service or your tax advisor. Using the portal is possible also independently by registering yourself. In any case, the use of the benchmarking portal is free of charge.

The portal is accessible at <https://benchmarking.zbg.uni-hannover.de> (in German only). Please check out the given example assessment reports for the different horticultural branches even without registration. The cockpit view gives an overview of evaluation results in terms of the four most relevant dimensions:

- | profitability in the current year
- | profitability in the past year
- | liquidity and
- | personal drawings.

Further gauges show productivity indicators in terms of labour, land and operating profit margin relative to the benchmark farm data from the network.

Carry Packs

The plastic plant packaging ensures that your plants are displayed at their very best in the shop. Even when the plants are packed in plastic, the transparent material and high-quality packaging ensure that they are displayed in a way that does justice to the appearance of the plants themselves.

Carrypacks

Voges Verpakking has developed a carrypack design for large plants, allowing you to deliver the plant complete with its pot. This is ideal for cacti in particular, as it is a way for you to protect customers and other items in the trolley from the sharp spines of the cactus. These types of plant packaging also allow you to make combinations, you could package three different cacti together, for example.

Codema's mobile gutter system

Codema has, based on its knowledge and experience, developed an advanced automatic moving gutter system for fresh lettuce, herbs, micro vegetables and baby leaves.

The moving gutter system optimizes the harvest of the crops. The system can be adapted to the needs of the customer. Grower Meier Brothers explains: "Lettuce harvest is about four to five times higher with NFT." This system is more hygienic and saves water during cultivation and also during the cleaning of the lettuce for sale. The production process can be automated, which saves labor costs. Moreover, the product has a longer shelf life because the lettuce plants are harvested and sold with the roots attached. NFT provides a good return on the investment."

Codema has tested the system, thoroughly. "Our customers can now count on a predictable, reliable harvest 365 days per year. We currently have different types of lettuce systems available: traditional banking systems, floating lettuce and (semi-) automated moving gutter systems."

3GG Gear Motor

Introduction of 3GG Gear Motor

1. The failure rate of the limited switch is reduced to 5 ‰ from 5%.

At present, the most common quality problem of the gear motor is the damage of the limit switch control system. The main reason is that the self-locking performance of the gear motor fails to be qualified and the braking distance is too long. The statistical results of advanced gear motors show that when the braking distance is less than 10 mm, the failure rate will be greatly reduced.

In addition, it is predicted by the engineers of world important users that the braking distance of 3GG gear motor is less than 5 mm (5.2 rpm) and the failure rate is reduced to 5 ‰ from 5%.

2. Self-locking performance is excellent, to meet the high precision window system.

3GG adopts the last stage worm self-locking transmission system, which greatly improves the self-locking performance. Even the braking distance of the of 5.2 rpm gear motor (usually 2.6 rpm) can reach less than 5mm, which fully meets the requirements of high-precision windowing system and prolongs the service life.

3. Adding overload protection and power phase loss protection function.

3GG gear motor adds overload protection and power phase loss protection functions to the limit switch control system. When the three-phase power supply becomes two-phase, it automatically stops. When the load exceeds 1.5 times the rated load, it also automatically stops. After troubleshooting, the motor runs again, thus greatly reducing the number of after-sales service.

4. Adding the manual opening and closing device for power failure.

In the animal husbandry industry, when the windows are closed, the indoor temperature rises rapidly if there is power failure, which affects the growth of indoor poultry or causes a large number of deaths. Manual devices are now added, which when the power is off can be operated manually to open windows or to draw curtains to ensure the normal operation of livestock houses or greenhouses.

GC WiFi

The light recipes of this grow light are controllable by GC Signal. The GC WiFi offers even more options for customisation through pre-set and user defined operating modes.

It is also possible to simulate sunrise and sunset or to control the distribution of light in real time – all conveniently with the Greenception App.

The integrated five light channels make this Greenception product unique.

With these varied possibilities, plants can not only be compressed: Colour, flowering time, active ingredient and vitamin content as well as taste can be influenced in a targeted way.

At the heart of each cluster is the highly efficient full spectrum COB chip, which is complemented by eight smaller SMD chips.

The COB chip emits a light that the human eye perceives as white. In this way you can observe the plant without additional lighting and detect diseases or pests earlier.

Area of application

The GC WiFi is a compact LED module for grow boxes up to 75 x 75 centimetre. Due to the individual light recipes with their many options and the control via GC Signal and App, this grow light is a professional solution for demanding users.

Phormium cookianum 'Blondie' PBR

Key Features

- | Unique weeping plant habit similar to a *Chlorophytum*
- | Fine narrow long variegated foliage
- | Outstanding container specimen

Characteristics

Hardiness: USDA Zone 8. (15 Fahrenheit or minus twelve degrees)

Foliage: Unique narrow weeping, cream and green variegated foliage

Habit: Tight clumping habit; weeping foliage give a unique distinctive look. 0,90 x 0,60 metre (at maturity)

Culture: Best grown in part shade; feed regularly with high nitrogen

Additional Comments: Plants will exhibit best color when grown in part shade and fed weekly with a well balance fertilizer high in trace element. Remove old foliage at the base and keep in active growth. Plants will loose color with age if not tended correctly.

Uses: Specimen containers, borders, mass landscape planting

Jumbo Jumbo Yellow - the crispy touch

Yellow, yellow and yellow again: The Jumbo Jumbo Yellow has remarkable big flowers with an intensely bright yellow colour and a heart that turns into orange pollen when the plant gets older. The unique structure of the 'crispy paper like' petals will grab your attention straight away. Its easy to grow, lasts long and blooms early. Insider tip: The flowers can be harvested to use as perfectly dried flowers or fresh potpourri.

The Jumbo Jumbo collection puts a smile on your face right away when you touch it for the first, second and even third time. Jumbo Jumbo is a collection of Xerochrysum (Bracteantha) with very big and long lasting flowers and a unique 'crispy' structure that reminds you of thin paper. There are multiple Bracteantha on the market but the Jumbo Jumbo variety is way stronger, has better branching and is earlier blooming. In addition, it is very easy to propagate and to grow and it has a strong garden performance.

Basewell™ and GreenGuard Poinsettias

Dümmen Orange launches Basewell™ and GreenGuard Poinsettias.

Basewell™

In the Innovation Kitchen visitors can experience the innovative and sustainable ways of working. A lot is going on in the kitchen, Dümmen Orange officially presents Basewell™ for the European market with trial packages for pelargoniums. Basewell™ is a new product form produced at off-shore farms that combines the benefits of unrooted cuttings and rooted cuttings. It is more mature than an unrooted cutting, with visible root development making it possible to plant directly into a finished container.

Basewell™ is fast and efficient to transplant with no losses. The rooted cuttings respond quick after transplant and grow uniformly. Basewell™ allows growers to significantly reduce labour and reduce propagation greenhouse space. Basewell™ allows growers to adhere much closer to their planned schedules by further eliminating the variables in the propagation processes and delays in liner to production transport processes.

GreenGuard Poinsettias

In another part of this booth, Dümmen Orange presents its new sustainably grown poinsettias, the latest result of its GreenGuard protocol ('Minimal Chemicals, Maximum Quality'). With an eye for innovation and sustainability, Dümmen Orange is developing a future in which the level of chemical pesticides on its cuttings is reduced significantly to protect people and the environment. In addition, this program allows the company to fulfill customer requests as the demand increases for sustainable products grown with fewer chemical pesticides. The clear path to meet these production demands is to follow the principles of Integrated Pest Management. More products will follow soon.

Hydrangea RUNAWAY BRIDE 'Snow White'

RUNAWAY BRIDE® is an entirely new class of interspecific Hydrangea hybrid that flowers not only at the end of the stems, but also from all lateral buds from the previous season.

The lacecap inflorescences are bordered with large, elegant sterile florets in pure white, often flushed with pink during cooler weather. Due to the unique flowering habit and garland-like stems, this type of hydrangea can be grown into totally new product forms – in addition to standard pots/containers, RUNAWAY BRIDE can also be grown in hanging baskets, on trellises, pyramids, columns and more.

The unbelievable profusion of flowers, its elegant beauty – and the fact that this variety has proved to be reliably remontant all summer long – are attributes that will make this variety very popular with home gardeners. The vigour, elegant spreading plant habit and good hardiness make it for a fantastic garden and container plant.

New Imara® from Syngenta Flowers delivers breakthrough in impatiens walleriana

New Imara® from Syngenta Flowers delivers breakthrough in impatiens walleriana

- | More resistant to downy mildew than ever before
- | Imara is bringing back the gardener's favourite plant
- | First to market with new and improved impatiens walleriana

Syngenta Flowers is proud to announce the return of impatiens walleriana with the new series, Imara®. Launching in the U.K., Germany, France and the Netherlands, this breakthrough impatiens walleriana is stronger and more resistant to downy mildew than ever before.

Since the widespread outbreak of downy mildew in 2011, the impatiens walleriana market has drastically declined. However, Imara® offers disease resilience so growers can bring this popular plant back into production and retailers can reinvigorate the market by putting a consumer favourite back onto shelves.

"Syngenta is a research and development company. We do innovation, so developing a new generation of impatiens walleriana has been important to us," said Michael Kester, Global Head of Syngenta Flowers. "We are very excited to be first to market with this breakthrough and bring back a product that will delight consumers with outstanding performance in sun, shade, rain or shine. We know this will translate to a strong, sustainable consumer demand to benefit retailers and growers."

In addition to its resiliency, Imara® offers growers a reliable, low-maintenance and economical plant for greenhouse production. It is robust and durable, holding up well during transport so plants stay in top shape when moved to retail.

IPM ESSEN

A powerful trio against fungus gnat larvae

Almost every area of horticulture is familiar with fungus gnats and their larvae. Especially seedling producers are afraid of them. Fungus gnat larvae are not choosy for roots, whether poinsettia, bedding and balcony plants, herbs, vegetables, hardwood cutting or herbaceous perennials, their diet includes all those roots. Chemical crop protection can hardly provide any possibilities for action. Therefore, it is great that biological plant protection can offer good alternatives to cultural and biological techniques (such as yellow catchboards for monitoring or drought stress).

The powerful trio consists of the nematodes *Steinernema feltiae*, the predatory mite *Hypoaspis miles* and a BTI. *Steinernema feltiae* are threadworms that are being poured into the plants. They are either contained in clay granules and then dissolved in water or they are poured as ice nematodes. *Hypoaspis miles* lives on the soil and, besides fungus gnats larvae, also eats thrips and springtails.

They are being scattered onto the plant substrate in the carrier material, a mixture of vermiculite and soil. *Bacillus thuringiensis israelensis* (BTI) is being poured. The methods described are used preventively in the first week after seeding, pricking, plugging or planting and should be, according to the requirements of the plant culture, pursued continuously.

Grafted Hot Peppers

Hishtil's grafted hot pepper plants are sharp flavoured, vibrant and beautiful and help increase yields.

The product list of grafted hot pepper plants includes the following types:

- Capsicum hot pepper 'Magnum' (Habanero) Grafted
- Capsicum hot pepper 'Maya' (Habanero) Grafted
- Capsicum hot pepper 'Touro' (Jalapeno) Grafted
- Capsicum hot pepper 'Budapest' (Hungarian) Grafted
- Capsicum hot pepper 'Fire Flame' (Chili) Grafted
- Capsicum hot pepper 'Dorset Naga Red' (Morch) Grafted
- Capsicum hot pepper 'Jamaican Yellow' (Scotch) Grafted
- Capsicum hot pepper 'Big Devil' (Chili) Grafted

Like other grafted vegetable plants, grafted hot peppers have proven to be superior performers, having robust growth, longer fruiting and higher resistance to soil disease. Benefits outweigh costs when factoring in an increase in yield and a reduction in chemicals for disease prevention. These advantages make them clear favourites for commercial growers and home gardeners alike.

Pot Roses with enchanting Fragrance

The Queen of Pot Roses – the international acknowledged rose breeder Rosa Eskelund from Roses Forever – presents a brand-new series of long-lasting fragrant pot roses with large flowers.

Pot roses with fragrance are very difficult to breed, and when you add long life of minimum three weeks and large flowers, you really have a challenge ahead of you.

Nevertheless, rose breeder Rosa Eskelund took up the challenge and after ten years of breeding she is now ready to present four amazing varieties with large fragrant flowers and a beautiful dark green foliage. All four new varieties have a very pleasant fragrance with large long-lasting flowers and are for both indoor and outdoor use, so Rosa Eskelund, who already has been breeding a long line of international bestsellers sold under the brand names Infinity® Roses, Roses Forever® and Love Forever®.

Four new varieties

The new varieties will be marketed under the brand name *Love Fragrance Forever*. The new varieties are all ready for the market from March 2019.

Stop and smell the Roses

Rosa Eskelund is a breeder with passion for her roses. That is also why her new fragrant pot roses will be presented under the slogan *Stop and smell the Roses*. "I heard this expression about *Stop and smell the Roses* some time ago. It is so true, because we all live busy lives, and it is important sometimes to "*stop and smell the roses*" and see our lives with a deeper appreciation of the world around us. It can help us to slow down and be aware of all the little things that makes life so beautiful. It is more than ever important to take a break and be present in the moment; otherwise those moments will pass you by", says Rosa Eskelund.

Hyperion™ Greenhouse LED grow light

Plessey Semiconductors have specifically designed the Hyperion™ grow light to deliver greater returns for commercial growers. The Hyperion™ grow light can work alongside or can replace high pressure sodium grow lights. With Hyperion™ you need less units for any given lighting installation than with competitor LED grow lights. Being 1:1 equivalent with existing 1000w and 600w sodium grow lights makes Hyperion™ easy to install and to use for growers, installers and greenhouse builders.

Key features

Up to 1800 µmol/s and 1000 µmol/s light output options

Equivalent to 1000w and 600w sodium grow lights

Up to 40 per cent energy saving versus sodium

Up to 3.0 µmol / joule efficacy (after driver and optical losses)

100 per cent LED or hybrid with HPS installation

Key features continued

IP66 rated for full pressure power wash cleaning

IP68 rated fan on Hyperion™ 1750. Dust tight and prolonged immersion

Range of proven spectrums for different applications

Tailor-made spectrum to suit grower requirement

Low shading and installation costs

Five years guarantee/ 25,000 hours

Leasing options

Benefits

Fewer units required per install than any competitor LED fixtures

Less overall shading than any competitor LED fixtures

Lower installation costs

Install on existing trellis to avoid extra c-profile cost and shading

Greater flexibility on lighting design and positioning

Even light distribution possible between 5 metre poles

Options

Reflector accessory to ensure uniformity at the edge of installations

AS 1200 - new spraying procedure for plant protection

With the AS 1200, Birchmeier Sprühtechnik AG has developed a new device with air-supported spraying technology. The device combines the benefits of conventional nozzle spraying with a controlled air stream. As distinguished from a mist blower it uses the very latest electronics and rechargeable battery technology.

At the heart of the AS 1200 is an easy-to-use, portable blower with an electronic control system and an integrated spray nozzle. Spray solution is fed into it at a pre-set pressure via a hose from a rechargeable sprayer and mixes optimally with the air stream. The blower power can be set to various levels depending on the application. From a gentle breeze when working next to a wall of leaves, to a powerful hurricane, when working at a distance of ten metres or more - everything is possible. With this new process, users can penetrate existing plants better. The AS 1200 is quiet and produces no exhaust gas.

The blower is designed as an additional device and works together with a sprayer from Birchmeier's «Accu-Power» line. These rechargeable devices developed by Birchmeier in recent years have received a number of international prizes for innovation. Anyone who owns a rechargeable backpack sprayer from Birchmeier can combine it with the blower. However, the blower requires an additional high-performance rechargeable battery. This is designed to allow several hours' spraying depending on the blower's power setting. The latest electronics ensures straightforward, reliable operation. This device too is "Made in Switzerland".

Nature's Melody - Symphony Tunes

New in the Nature's Melody range at Wagner Life Design is the Symphony Tunes wind chime.

The handcrafted Symphony Tunes wind chime convinces through its elaborate workmanship and high-quality finish. The five thick tubes made of partially recycled aluminum are finished with a premium powder coating. Each tube is precisely tuned. The canopy and the sails are made of rubber wood in walnut color. Through the four clappers a symphonic, long-lasting sound is achieved.

The wind chime is suitable for in- and outdoor use.

The article SYM48BK has the dimensions 19 x 19 x 121 centimetre and weighs about 2.1 kilogram.

Guernsey Clematis - young plants

Guernsey Clematis Nursery produces the majority of its young plants in seven centimetre pots, as a twice pruned liner for sale to the UK and Europe. This same product can be washed free of soil and despatched further afield to North America, South America as well as China and other countries.

The company also has a smaller range grown in 3.1 centimeter Ellegaard plug pots and grown to order.

Spical Ulti-Mite: New sachet improves spider mite control

Following the success of a newly patented packaging concept by Koppert Biological Systems, [Spical Ulti-Mite](#) is now available in a high-tech foil sachet that ensures consistent performance in variable climatic conditions. Compared to other regular paper sachets in the market, the Spical Ulti-Mite foil sachets perform up to three times better. Trials have proven that Spical Ulti-Mite consistently delivers higher numbers of predatory mites under challenging conditions.

Extensive research has resulted in a sachet that creates a better environment for the predatory mite to build up its population. The superior quality of the foil ensures the breeding system is better protected against environmental conditions that may affect the mites emerging from it. The sachet is narrower and slightly longer and gives the mites the very best conditions to develop even more swiftly and strongly.

Spical Ulti-Mite, which is widely used to control spider mite in a variety of greenhouse crops, can now also be applied to outdoor crops such as citrus and grapes. With the introduction of Spical Ulti-Mite, Koppert aims for more security for both grower and crop.

The new Spical Ulti-Mite sachets can be disposed of together with the crop waste. The sachet is made of a newly-developed foil that conforms to the required industrial compostable standards. In addition, Koppert Biological Systems has reinforced the hook from which it can be attached to make it even more robust.

The greener side: Botanical by Scheurich

Botanical by Scheurich now expands the popular Urban Jungle, with the new Tropical Garden and Palm Garden, making the presence of green plants once again a lifestyle choice with the feel-good factor guaranteed. The broad-leaved decorative pot designs appear realistic and are eye-catching a real recipe for relaxation. They are perfectly suited to the zebra plant (*Calathea zebrine*), monstera (*Monstera deliciosa*) or parlour palm (*Chamaedorea elegans*).

Green living knows no boundaries. A natural lifestyle harmonises wonderfully with Scandinavian design and transforms a classic, cosy atmosphere into the on-trend "Hygge", and everyone can use a little more of that! Botanical is available in sizes up to XL and makes greenery centre stage without compromises. Put on the floor, small urban-living gardens emerge, which create fresh air so that you can breathe and relax.

Pictures, pillows and blankets featuring leaf motifs as well as use of the colour sage green, co-ordinate well with these new cover-pots. Interesting arrangements can be created by combining Tropical Garden and Palm Garden with the popular Scheurich cover-pots in Panna and Anthracite.

To keep the green oasis dry, these high quality cover-pots are manufactured from 100 percent waterproof ceramic.

GreenPlan

Manage your production planning and economic forecast: GreenPlan is a planning software designed for pot plant growers.

GreenPlan is highly focused on precise timing of sale and has a number of features making it easy to assure that the right mix of varieties and colours will be available in due time; it makes it immediately visible for the planner, whether a production is candidate for up scaling or down scaling.

- | Forecast earning at crop level
- | Plan after your peak sales
- | Planning on day or week level
- | Overview of production and consumption of cuttings
- | Multiple cultivation recipes per variety
- | Graphical plan over your space consumption
- | Calculate the culture's consumption of heat, electricity, CO2 and growth light
- | Price calculator for Added Value

Benefits for the user:

- Easy use
- Easy look at planning alternatives
- Production plan and budget in the same process
- Quick overview of profit, costs or hours consumption
- Quick presentations to colleges on screen or handouts

Flowerbox

The trendsetting box which has a huge popularity all over the world, is now available in European florist supplies as well – the sophisticated decoration of interiors and the embodiment of the perfect gift now starts its conquering journey.

Flowerbox is versatile, elegant and affable. Each box is a work of art, where – thanks to the translucent surfaces – the flowers are visible from all sides. It can make any occasion unforgettable. It not only keeps the memories of the celebrations long, but also the freshness and beauty of the flowers placed in it, so it is a unique product for florists as well.

Thanks to the help elements in the box, the flowers can be placed easily and in a variety of ways, as well as they keep the original shape of the composition. Using this box you can assure long lasting freshness up to two weeks for the flowers, whether these are roses, tulips or ranunculus. It is also a product of great practicality: easy to transport, not fragile. It closes securely so even by moving or transporting the box the flowers in it cannot move and the water cannot run out.

Its unique look and exclusivity can be enhanced by the own stylish logo of the florists, so the Flowerbox also provides a special tool for self-promotion. This high quality product is foremost in Europe made in Hungary to supply the European market in a quick and creditable way.

PAT with new developments

The continuous development of the ERP software PAT brings many enhancements and adjustments for the users also for 2019. With the beginning of the migration to PAT-Enterprise, PAT is made future-proof to be able to use current and future technologies in the coming years. This is shown, for example in the improved possibilities of scanner use.

By networking different modules, PP-Area, the area planning of Plug-Plant, can be used without any additional effort. The evaluation of the areas can be updated here without having to collect additional data. The data maintenance in PAT is sufficient for this.

The web portal of Plug-Plant also retrieves its data from PAT. Thus, it is possible to provide information such as orders, delivery processes or availability, customer-specific on the Internet.

For the sales force, there is the new version of PATplus. Now the data can be processed by different suppliers. New orders can either be exported via e-mail as an excel sheet or for a fully automated import. Various customer requests have been integrated into new functions.

In combination with the mail program David and the financial accounting of GDI, Plug-Plant offers a package of coordinated programs including personal, direct support with specialists from the green sector.

SANANBIO is backed by the world's largest LED chip manufacturer

SANANBIO is backed by the world's largest LED chip manufacturer, Sanan Optoelectronics. The company does not only bring large-scale manufacturing capabilities, but also an R&D team capable of customizing and designing lighting to the specific customer or plant needs.

The easiest way to achieve effective agricultural lighting is to provide a spectrum of light that best replicates sunlight or by providing the necessary spectrums / color combinations for specific functions. Color combinations vary depending on region, time, temperature, plant, plant cycle, production targets and many other factors.

SANANBIO has all the basic colors needed for replicating sunlight and activating specific functions for agricultural lighting. For any part of the spectrum where additional colors need to be added to the spectrum or additional light functions are needed, there are different SANANBIO color LEDs available for customer selection and tuning.

RootBarrier® RollRib®

The RootBarrier® RollRib® is an innovative root guidance system on a roll and is made of 1.5 millimetre high density polyethylene (HDPE). The RollRib® has integrated vertical guidance ribs and is 100 per cent recyclable. This system is easy and faster to install than alternative products due to the different lengths of 21 and 75 meters.

In addition, the RollRib® is easy to cut to the desired length thanks to the cutting line that is on every meter of the roll. With this system roots are guided carefully downwards. Because it has guidance ribs every 18 centimetre, it can be placed either in a line, in a square or in a circle surrounding the tree. The RootBarrier® RollRib® has integrated soil anchors, which prevent the tree roots from pushing the RollRib® up. Sections of RollRib® are easily and quickly joined by means of the enclosed screws.

Innovations for steaming

Inefficiencies and progressive resistance with weeds and diseases as well as prohibitions and restrictions for herbicides are drawing increasing attention to steaming. Steaming methods can be used in all sectors of horticulture – both in the greenhouse and on open land. The steam boilers from MSD are the only ones in the field of steaming to meet the high safety standards pursuant to the directive 2014/68/EU with the CE mark, the Federal Emission Control Act and the Industrial Safety Ordinance.

When applied in horticulture, the modern, time-saving and energy-efficient cover steaming process is prevailing at an increasing rate. On open land, semi- and fully automatic steamers are already being used successfully on large areas, especially in vegetable and forest nurseries. A technical development is the use of spiked covers for so-called sandwich steaming. In this case, steam is applied by means of 17 centimetre long spikes to a depth of around 25 centimetre. Initial experience resulted in energy saving of 50 per cent over conventional cover steaming.

Steaming also has a good effect on combating weeds, soil-borne diseases and pests as well as soil fatigue for strawberries.

For this purpose, MSD has developed a dam steaming device which steams dams laid with mulch film and, at the same time, pierces the planting holes.

Sansevieria laurentii

Sansevieria is commonly known as snake plant or mother in-law's tongue.

As houseplants, *Sansevieria* thrive on warmth and bright light, but will also tolerate shade. They can rot from over-watering, so it is important that they are potted in well-drained soil, and not over-watered. They need to be re-potted or split at the root from time to time because they will sometimes grow so large that they break the pot they are growing in.

It is one of the best plants for clean indoor air. Easy to care for.

Double flowered Hydrangea macrophylla varieties Felina ?, Florentina?, Feather? and Flame?

A clear focus of Hydrangea Breeders Association BV (HBA) currently lies in the breeding of double flowered hydrangeas. In addition there is also a focus on the plant production for the grower and a lasting joy to the end user. Some breeding goals here are the naturally compact growth, the total plant structure, stability of the shoots and the keeping quality at the consumer.

This year, the HBA presents four new macrophylla varieties, two mophead hydrangeas: **Felina?**, **Florentina?** and two lacecap hydrangeas: **Flame?** and **Feather?**. These differ in the individual flower size and the color gradient in the maturation process. The novelties combine very well in production characteristics with the other HBA varieties.

Features:

Felina? 'H217901'

Double flowered mophead Hydrangea, compact growth, strong shoots, very good branching, well suited for 9.5 to 17 centimetre pots, color: light pink / light blue

Florentina? 'H217902'

Double flowered mophead hydrangea with large sepals, middle growth, strong shoots, very good branching, good for small and larger pots, color: light pink / light blue

Flame? 'H217903'

Double flowered Lacecap hydrangea with large sepals, strong growth, strong shoots, very good branching, good for larger pots, does not moult, color: pink / blue

Feather? 'H217904'

Double flowered Lacecap hydrangea, strong growth, strong shoots, very good branching, also suitable for small pots, does not moult, color: pink / blue

EMMA 2.0 - Portable device for moving of mobile benches

On basis of the container (mobile benches) moving system, so called "Emma", which was developed by Mr. Jörg Reischl from Duderstadt (Germany), the device "Emma 2.0" was more sophisticated by company Otte Metallbau GmbH & Co. KG (Barßel-Harkebrügge, Germany). The innovator, Mr. Reischl was priced with „Innovation price horticulture 2019“ in the category „technic“ for his system „Emma“. The machine was developed as simplification measure for the moving of containers in manual mobile bench systems.

According to customers statements "Emma 2.0" was rated as handier during diverse trials and assumed with a positive feedback. The machine is equipped with two suspension devices to clamp to a mobile bench and two holders for the manual transportation of the 24 kilogram heavy machine. By the use of the two holders, the device is flexible man-portable from one mobile bench to another or from one mobile bench track to another.

"Emma 2.0" moves by four magnetic rollers onto the track pipes of the mobile bench system and has the possibility to carry 20 mobile benches at the same time within one mobile bench row. By means of a 4-channel remote the device can be moved within three speed levels forwards and in one speed level backwards. The power supply is done by a lithium-ion battery.

Growfoam

Growfoam is a patented **biodegradable plant substrate** for seedling germination and plant cultivation.

The dimensionally stable, **peat-free** and **clean** plant foam-substrate is produced from biodegradable biopolymers and natural additives. Depending on specific crop requirements Growfoam can be tuned in composition, foam morphology and foam cell size. By tuning the foam substrate to the requirements of young plant growers, Foamplant is able to deliver a **defined water capacity and air capacity** suited to every crop.

Growfoam passed all required tests on biodegradation in order to acquire the **OK Compost** certificate from **TÜV Austria**. Growfoam substrate plugs are

certified biodegradable, conform the EN 13432:2000 norm. During biodegradation Growfoam will decompose in H₂O and CO₂ without effecting plant growth.

Revolutionary biobased and biodegradable stake that feeds the plant

Voodstoc introduces a plant label display stake that feeds the plant. In collaboration with the University of Wageningen and Rodenburg Biopolymers they developed this particular stake. During a period of ten weeks it gradually releases the food to the plant.

Voodstoc is not only bio based, but also biodegradable. It fits perfectly in the new way of thinking about the circular economy. Offering a sustainable alternative for fossil fuels, the company uses starch obtained from waste from the potato industry. The raw material for Voodstoc is already in the circular production circle. An excellent alternative to the wooden stakes, which deprives new wood to nature.

COIR PITH - a growing media for Agri/Horticulture Applications

Coir pith, the by-product of dehusking of coconut fibre, is the spongy material that binds the coconut fibre in the coconut husk. As an excellent soil conditioner, it now finds varied uses as a good manure and in horticultural applications as a soil-less growing medium. Coir pith is a substitute for peat moss which is widely in use in European countries and is made available in various forms like organic manure, grow bags, briquettes, discs and more of different sizes.

Let's get glossy - highgloss for every room

The new Glossy collection from LECHUZA brings a hint of glamour to the living room. The planters with high-quality varnished surfaces give rooms an elegant feel. The trendsetting pieces do not only look sophisticated, but also impress with their integrated irrigation system, giving plants access to a reliable water supply. The new Glossy planters are the must-haves of the season.

Following a high-gloss makeover, the popular LECHUZA planter CUBE now comes in three additional brilliant high-gloss shades. The high-gloss surface forms a modern contrast to green houseplants or delicate flowers, making CUBE Glossy a real eye-catcher. The larger CUBE Glossy Triple offers a lot of space for flowers, herbs or smaller shrubs and serves as a sophisticated highlight that will give any living space a glossy feel. With its elongated shape, the new planter can be an impressive herb garden on the windowsill, a garden for succulents on the living room shelf or an unusual flowering decoration on the table.

With the Green Wall Home Kit Glossy by LECHUZA, a well maintained, hanging garden that gives a new perspective on green and flowering plants can be created in no time at all. If you don't have much space or simply enjoy unusual plant designs, you can now bring a touch of nature to your very own wall. As classic wall greenery, as creative holders for make-up tools in the bathroom or as pencil box in the children's bedroom – the Green Wall Home Kit Glossy is a true all-rounder and highly versatile.

To make sure that caring for your plants doesn't get too stressful, the LECHUZA irrigation system will look after the water supply for your green flatmates. The plants can be placed in the planter in their pots, eliminating the need for time-consuming repotting. A wick, which is placed in the pot from below, transports moisture to the roots. This is how easy it can be to take care of your plants.

New dwarf azalea offers year round ornamental value

Easy to grow and resistant to heat and cold is Rhododendron Encore® Autumn Fire ('Roblez'). Year round you can enjoy this dwarf azalea which is about 75 centimetre high and wide. Encore® Autumn Fire flowers twice a year (spring and autumn) with bright red flowers. In winter, the foliage colours from shiny dark green to purple-bronze.

Encore® Autumn Fire grows well in a moist, well-drained soil in the sun or semi-shade. Due to its compact growth, Encore® Autumn Fire is very suitable for mass planting or for balcony or terrace. It is also a wonderful addition to the shrub border. Encore® Autumn Fire is hardy to minus 20 degree and is found by Robert 'Buddy' Lee of Plant Development Services Inc. from the United States.

Malus 'Royal Raindrops®' exclusive by Ley

Eye-popping magenta pink blooms, deep purple cutleaf foliage, sparkling red fruits and bright fall color give all-season appeal to this easy-care flowering ornamental. Superior disease resistance, adaptability, plus heat and drought tolerance make this unique crabapple a crown jewel among trees.

Refined, uniquely shaped leaves emerge glossy deep purple and maintain their rich color through the heat of summer. Fall color is a madly of bronze, orange and purple. Tiny persistent, bright red fruits appearing in late summer are prized by wildlife and add winter interest. Strong branch angles and upright growth habit minimize the pruning and shaping needed to develop a balanced canopy. More vigorous than other purple-leaved cultivars, 'Royal Raindrops®' Crabapple quickly gains caliper while developing a sturdy, well-tapered trunk.

Coco Substrate (Coco Peat)

Kokosflora coco substrates are soil enhancers which are mixed with peat moss to enhance soil characteristics such as drainage, aeration and water holding capacity to promote better root growth in horticultural applications.

Kokosflora coco substrates are also a preferred medium in soilless cultivation directly as it can be used for many cultivation cycles over several years before replacing. Coco substrates are collected as by-product out of coir fiber extraction from dried coconut husks. Hence it is an environment friendly 100 per cent natural growing medium from renewable coconut plantation with no deforestation. Kokosflora coco substrates are triple washed to remove excessive water soluble salts and other impurities to bring the electrolyte contents within the range.

Vertical Gardens - Roof Gardens

Vertigan presents a range of innovative developments in vertical gardens - "Indoor" at home, in the working place, in the office. Can be combined with hydroponic system and "Outdoor" to cover concrete walls, house facades, fences, concrete pillars, bridges and public buildings.

All products are equipped with automatic irrigation systems.

For roof gardens Vertigan has developed a smart system to cover the roof in a green garden where you can grow flowers, grass, green vegetation, organic vegetables and even ornamental trees or fruits.

The system allows to make any flat roof of the parking lots or any unused flat roof into a beautiful garden. All with a do-it-yourself system and like the vertical gardens, equipped with automatic irrigation systems.

All systems have no direct contact with the building walls or floors, so no moss is formed, which harms the building.

Vertical landscaping and roofs gardens add an additional layer of thermal insulation to existing insulation systems.

The innovations focus on very easy assembly, easy maintenance, water saving, fertilizer savings, and ultimately very important, low prices. All products can be set without professional help.

Thanks to the modular system, you can start with a small base unit and expand it to a very big magnificent garden. All extension units matched together as Lego game bricks.

Another development is "mobile vertical gardens". They serve as mobile green partitions in banquet halls, hotel lobbies, wedding festive events background, fairs and exhibition pavillons.

All facilities are decorated with live plants and equipped with automatic irrigation. Replacing the plants to change the design takes only a few minutes. The systems are equipped with quiet and hidden wheels so they can be moved easily.

Many novelties especially for young city gardeners

Hauert MANNA Düngerwerke GmbH is presenting its current range of products. With the traditional brands Hauert, Manna, Manna Bio, Biorga and Wuxal, the company covers the entire spectrum of plant nutrition for the professional and home garden sector.

Above all, the Manna product range was decisively further developed last year. It is primarily aimed at the growing group of young city gardeners. Accordingly, the new products are available in handy, not too large, attractively designed packages.

Among the special fertilizers are both conventional and organic products. Their application is simple and over- or underdosing is hardly possible even for garden beginners. All are easy to spread and can be applied dust-free.

New, for example, is the "Manna Rose Fertilizer" or the "Manna Tree, Shrub and Hedge Fertilizer". Most hobby gardeners today rely on purely organic fertilizers, especially in the kitchen garden sector, because they want self-grown fruits and vegetables in organic quality. For them there are now nine new organic products in the Manna range, including universal fertilizers such as "Manna Bio Hornmehl" and special fertilizers such as "Manna Bio Obst- und Beerendünger" or "Manna Bio Hochbeetdünger". They all contain exclusively natural ingredients that are slowly broken down by the microorganisms in the soil and are then available to the plants as nutrients over a long period of time.

A "Manna Organic Lawn Fertilizer" can also be found in the current catalogue as well as a whole range of other lawn care products: For example the "Manna Lawn Fertilizer Premium", which was specially developed for demanding playgrounds and ornamental lawns.

«Accu-Power» line from Birchmeier converted to CAS

Since joining the [Cordless Alliance System \(CAS\)](#) in September 2019 Birchmeier has now converted the devices of the «Accu-Power» line to this cross-manufacturer battery system. This means that the REA 15, REB 15, REC 15 and REX 15 backpack sprayers as well as the A 50 two-wheel sprayer, the BM 1035 pump station and the A 75 and A 130 wheelbarrow sprayers are equipped with a CAS battery. Birchmeier continues to offer various performance classes, but now with one standardized rechargeable battery platform.

As a result, users will be able to work flexibly with standard and special products from various manufacturers without having to stay close to a power socket.

The REC 15, for example, will be 30 per cent more powerful as a result of CAS. In the past, a single charge was enough to apply 170 litres of spray solution at three bar in five and a half hours. With the new system, 220 litres can be applied in seven and a half hours.

Since Birchmeier attaches great importance, as usual, to ease of use and practical equipment, the REC 15 was also equipped with the lockable brass hand valve LB.

Livium, a real work of art

Livium is a symbol for the 'next generation' in Anthuriums. The natural veins give a beautiful look and feel to the variety. This novelty really has the X-factor. Anthura is proud of this beautiful breeding result, which is likely to lead to a completely new line of pot Anthuriums in the future. The natural outlines and patterns on the spadix are particularly beautiful and give it a really special appearance.

The plant is suitable for pot sizes 14 and 17 centimetre. The flowers are medium in size and the predominant colour is red with clear white coloured veins in the flower. The shelf life of the plant is good to excellent.

Fresh-o-Fair

Fresh-o-Fair is a company that hopes to change the model of fresh flower sales in Europe. We present a concrete model for the implementation of B2B transactions through web platforms. At the beginning of 2019, Fresh-o-Fair started its operations in the German market. Our team is currently embarking on an expansion to the European and American markets.

The vision of the Project

We want to establish an international market for fresh Business-to-Business (B2B) flowers. The peer-to-peer concept became popular in 1999 with its implementation in data transfer systems. Probably its best-known implementation was Napster. The application of this concept to physical logistics networks is currently being implemented worldwide and it is only a matter of time before they are implemented in the fresh flower market. The question is not whether it will happen, but who will make a profit out of this transition.

Fresh-o-Fair wants to position itself as a strategic ally of fresh flower farms in the region. Fresh-o-Fair's business is to generate direct sales opportunities to Florists. Fresh-o-Fair does not expect to generate any profit margin by processing or facilitating transactions with wholesale customers of existing customers of producing farms, thus catalyzing the transition to the E-commerce of the future.

The digital transition of international trade in fresh products is inevitable. If this transition takes place, the benefits to the flower sector are extensive. Fresh-o-Fair hopes to lead this transition, generating tools to catalyze this transition of the flower sector and help local growers to navigate the new emerging models of international trade.

The product goes directly to the client, nonetheless Fresh-o-Fair acts as the importer and takes care of the entire logistics of exporting and importing the flowers to Europe. All the payments are also processed by Fresh-o-Fair. We are a German company so no international transactions to the Farms in Ecuador or Colombia are required. The client can choose from which farm to order their product and Fresh-o-Fair will make sure that the Farm in Ecuador or Colombia gets their Fair compensations for their product and that the Florist in Europe receives their fresh product at their doorstep.

The Farms

We currently work with some of the best flower farms in Ecuador and Colombia. Each farm has its profile. On this profile page, you can get more information about the certifications this farm currently has, their website and contact information.

The Prices

Our aim is to get fair prices for the Farms and at the same time offer competitive prices to the clients of the farms. We are able to offer this because we deliver the flowers directly to our clients. At Fresh-o-Fair we do not repackage the flowers, they arrive directly to your doorstep from the Farm. Because the Farms are getting a fair price for the product they can afford better packaging and higher quality control at source.

We invite you to form part of this new B2B platform.

Worldpremiere: seedalive® - a simple, non-destructive, reliable and rapid method for determining and predicting seed viability

Monitoring the viability of seeds is of paramount importance to plant breeders, traders, farmers, researchers and seed bank managers.

The globally recognized standard method to test seed viability is the germination test. Representative samples are sown according to genus-specific standardized protocols and after a certain period of time the germinated plants are counted to determine the proportion of germinating seeds in the sample. This method is proven and has been used successfully for decades. However, this method is firstly destructive, for example the sample is subsequently "used up". Secondly, this test is relatively slow and requires a lot of space, material and personnel.

Other established methods are also time-consuming or resource-intensive, equally destructive, use toxic substances and/or are not reliable.

Researchers at the University of Osnabrück, Department of Botany, have now succeeded in developing a new, non-destructive, efficient and reproducible method for determining seed viability up to practical maturity.

Individual seeds are incubated in an indicator solution for four hours, after which it can be quickly and easily determined only by visual inspection whether the seed is still vital, aging or dead. Supplementary investigations can even predict the further aging process.

Detailed investigations with a number of genera showed very good correlation between the results of the new method and the classical germination test.

In cooperation with the consulting company JayVee Green Consult Dipl.-Biol. Jens Varnskühler, also from Osnabrück, the team is now working for the market launch of this new development. Already in the first quarter of 2020, after commercial protection of the method and foundation of a spin-off together with the participating researchers, Prof. Klaus Mummenhoff and Dr. Samik Bhattacharya, the new seed test is to be launched on the market.

Tree measurement solution / innovation for sustainable plant growth

Tree measuring was never that simple, fast, cost efficient and accurate: In close collaboration with Holland's Wageningen university and Tree Centre Opheusden the TreeHug is developed. With the TreeHug, a one handed digital measurement tool, data is measured and transferred directly from the field controller to the office inventory management system.

Thanks to electronic measuring and direct data storage, one field worker can complete tasks that previously required two employees. TreeHug's smart data collection solutions for tree growers have the potential to save countless workers hours while improving inventory accuracy and data accessibility.

Lite-Net, the latest innovation for sustainable plant growth

Rethinking geo-textiles – that is the aim of Lite-Net and Lite Strips. Lite-Nets are an improved and more cost- and water efficient replacement for conventional tube systems. They can't clog or buckle, and the water is prevented from draining into the soil without saturating the root ball.

Lite-Nets absorb water and air at the surface and distribute it evenly, efficiently and extensively exactly where it is needed, the tree's roots. As an initial growth help for new plantations, the root ball is enveloped with the Lite-Net. The tree's roots have an effortless access to 100 per cent of the net's water and can grow through it's openings. The Lite-Net is 100 per cent biologically degradable after five to ten years.

Your Greenspiration Matchmaker - Plantarium's new promise

Plantarium will present its newly charted course. In the Bizz Holland pavilion, visitors and participants will discover what this formula can offer them. Plantarium will also be looking ahead to the themes of the upcoming edition on 26, 27 and 28 Augustus 2020.

The new role of Plantarium as a green trade fair and platform is summarized in the promise 'Your Greenspiration Matchmaker'. Visitors will discover what's new and learn about Plantarium's more comprehensive alignment with trends and developments in the green world. Market parties will also get a first look at what the new platform can offer their businesses.

Themes of the next edition will be further explained and discussed in detail with visitors to the trade fair. Plantarium has embraced a new approach to themes which will allow for the input of ideas and contributions from the visiting public.

Since 2019 the Plantarium trade fair has been charting a new course which prioritizes matches between inspirational themes and associated products and market parties. For Plantarium this represents an avenue to a broader target group as it uses the next few months to further refine its new course and formula.

Very smart: Artificial Intelligence in horticulture

As a new module in the **g-pda.®** family, JayVee Green Consult Jens Varnskühler presents the new **g-pda.®PlantDoctor**: using AI (Artificial Intelligence) and ML (Machine Learning) to increase your efficiency the smart way.

When checking your cultures just take a photo of a symptomatic leaf or a pest with your smartphone and the **g-pda.®PlantDoctor** immediately tells you which disease it is. Now scan the QR code of the affected stock and the **g-pda.®PlantDoctor** will suggest a treatment. In doing so, the already applied agents, incompatibilities and legal regulations are automatically taken into account.

In the next step, **g-pda.®PlantDoctor** checks the current inventory of the selected agent, calculates the area to be treated, the tank recipe and creates a task that you can assign directly to an employee.

flobox – a breath of fresh air on the flower market

If we can put anything in boxes and send it, then why not flowers as well? flobox offers an elegant, refined and original way of sending flowers, making imaginative table decorations and at the same time conveying personal congratulations or emotions.

What's special about it is that we don't just deliver flowers as a bunch, but as coherent arrangements in an elegant box. floboxes are individually made by hand with fresh flowers or preserved roses. Every flobox is suitable for shipping and sending by air, and on opening reveals a medley of floral treasures. The colour and size of the box, in combination with the types of flower chosen and their impact and symbolism means more than 200 different arrangements are possible.

ERCOLINO and BALCONETTE: functionality becomes elegant

The younger brother of Ercole has arrived: **Ercolino**. This new model is available in three sizes, the largest (800 millimetre in diameter) is equipped with guides for easy gripping with a hand pallet truck. Ercolino is the right combination of essential design and ease of use. The discreet presence and clear lines underline every type of plant and can be placed in any environment.

The well-known **Fenice series** has also been expanded with two new items, the **Balconette** with a height of 35 and 55 centimetre. Perfectly modular, both with each other and with the existing high cassettes (also from the Fenice series). The "Balconette" was developed to enable several compositions in small spaces such as terraces and balconies, enhancing the peculiarities of the line: the flatness of the surfaces, the essence of the shapes, the elegance of the lines - these two new pots are great for adding a touch of style to the place where they are placed.

The color range also extends and the **new Sand and Greystone colors** are added to the recent Bronzantico color, a warm and vibrant shade. Both are compound and "living" colors: sand is reminiscent of the soft color of desert sand; Greystone combines the delicacy and modernity of grey with the dynamism of color tones. Both are composite and "vivid" colors: Sand recalls the soft color of desert sand, Greystone combines the delicacy and modernity of grey with the dynamism of the color shades.

Cherry on top - in addition to being delicious, sweet, and productive, CROKINI is resistant (IR*) to late blight

Noted for the quality of its plant and unique taste, this variety **PREMIUM** has now revealed one of its secrets: its resistance to tomato late blight (IR*: Pi, Phytophthora infestans), one of the most devastating garden diseases. This disease is caused by a fungus that appears first on the stem and leaves, before contaminating the entire fruit. Mildew spreads particularly well in warm and humid climates and attacks most tomato varieties during the summer.

CROKINI: a success since its launch

CROKINI has enjoyed enormous success since its distribution on the vegetable young plant market. This small, round, cherry tomato has distinguished itself from the competition with qualities greatly appreciated by consumers:

- Deliciously sweet, + 8.5° of brix (sugar) • A suitable size, 16 to 20 grams
- Round plump fruits
- Productive, up to 317 fruits per plant
- Fruits that do not burst and remain on the plant
- A vigorous plant, specially adapted to the garden

**IR: Intermediate resistance*

Hybrid lighting solution for professional greenhouses

BLV is one of the very few providers in the market that offers a complete range of assimilation lighting: From lamps and power supplies to complete luminaires and from HPS or MH to LED, all from one source and perfectly synchronised with each other.

BLV introduces a hybrid solution: the well established, efficient and reliable HPS lights in combination with high performance LED interlighting. This hybrid solution is designed for greenhouses with high wire crops that aim for the best standards.

The HPS luminaires are equipped with a lamp and power supply produced in BLV's factories in Europe. The compact and solid design provides best-in-class PAR values and spectra for optimum plant growth. Safety, reliability, efficiency and durability are guaranteed. The open reflector allows an easy heat dissipation that increases the lifetime of the lamp. This can be translated directly into a reduction of maintenance and replacement costs.

The LED interlighting luminaires are available in different spectra, adapted to the needs of your crop! The passively cooled luminaire has been designed to optimise efficiency, light homogeneity and light absorption by the plants. The anodised aluminium housing is non-corrosive and classified with an ingress protection of IP66. Installation in a continuous line along the rows of plants is made easy thanks to feed-through wiring.

EcoFibri® – We now produce our own wood fiber

Sustainability has become the new standard and a key success factor.

With almost 20 years of experience in the substrate industry, CompaQpeat convinced that wood fiber is one of the most suitable alternative constituents for producing high-quality substrates.

Close to the production facilities in Latvia, the company produces its wood fiber under the name EcoFibri® with only carefully chosen coniferous woods using advanced production technologies.

During an optimized production process, the team generates temperatures of more than 120 degrees in order to produce a sanitized substrate constituent and guarantee optimum crop safety.

EcoFibri® offers various advantages:

- ? Increased air capacity
- ? Improved structural stability
- ? Optimized drainage capacity
- ? Strong root development
- ? Suitable for various segments
- ? Simplified fertilization due to a stable nitrogen level
- ? Savings in transport costs due to weight reduction

EcoFibri® significantly supports the strategic goal to increase the use of alternative constituents and stand for sustainable production of high-quality substrates. The certification process by RAL has already started and will be finalized soon.

Hortiviv – Enriched substrates of the future

In the past few years there has been a large development for the selection of beneficial organism capable of enforcing plant growth. Through creating natural symbiosis with plant roots, several of these organisms have shown to improve the resilience of plants. Greenyard Horticulture developed an innovative technology to bring these benevolent microorganisms to life, so they have a direct action at the plant roots.

Hortiviv® is a substrate inoculated with fungi, directly settled in the substrate in their living form. For two consecutive years, the University of Ghent and ILVO (Flemish institute for agriculture) used this inoculated substrate to conduct experiments during strawberry cultivation. These experiments showed that strawberries grown on the inoculated Hortiviv® substrate are more resistant to decay and improving thus significantly the shelf-life.

In addition, Hortiviv® can also be used for root sensitive tree cultivations, where it also has the ability to stimulate the plant growth and root vigor. Hortiviv® is allowed on the Belgian market for use in substrates (Derogation EM736.E).

Farm benchmarking 4.0: Get the answer to your question

How did the season go? Did my farm achieve a particularly good results or was it a good season for everyone? Which target values/benchmarks should I set for next year? Is my turnover per square metre of sales area fine, or is there still room for improvement? What about labour productivity? Have my new measures been successful? Is our cost reduction program showing success? What are the profit opportunities in other horticultural sectors?

Questions such as these are answered quickly and competently by the online inter-company comparison 4.0 for companies in all horticultural sectors. You can use the inter-company comparison 4.0 either directly as a company or in cooperation with the business management consultancy or the tax consultancy. In this way you quickly get the answers to the important questions of controlling.

The online applications now offers also short-term comparisons on a monthly or quarterly basis. This gives you a good and timely basis for operational decisions. Meanwhile, exchange of experiences groups from all over Germany use the system to improve their joint work. Each group can ask for customized analyses tailored for their special needs.

The inter-company comparison 4.0 is an online application that offers horticultural companies sound and individually tailored information for business management with little effort. Depending on the issue at hand, data from the annual accounts or the business management evaluation is required. Immediately after importing or entering the data, you have access to the interactive evaluation of your own data and comparison data from a precisely fitting group of farms.

Heterorhabditis downesi the new nematode

Under the name "Nemamax®" the nematode *Heterorhabditis downesi* will be available at the Sautter & Pepper GmbH from spring 2020 as new opponent of cutworms and a lot of different grubs.

This nematode is an excellent addition to its conspecifics *Steinernema feltiae*, *Steinernema kraussei* and *Heterorhabditis bacteriophora*. Like the conspecifics it transmits a bacterium (*Photorhabdus temp.*) which is transferred while invading and feeding on the larvae leading to its death. A big advantage of *H. downesi* is that similar to *Steinernema kraussei* it is already active at around eight degrees. The activity, however, maintains at increasing soil temperatures like *Heterorhabditis bacteriophora*. The perfect reproduction condition is between 15 to 25 degrees soil temperatures.

The application range of *Heterorhabditis downesi* is for a nematode very large. The host range includes not only the weevil larvae *Otiorhynchus* spp., but also pine weevil (*Hylobius abietis*) and other chafer grubs like *Phyllopertha horticola*, *Hoplia philanthus* and *Melolontha melolontha*. Even the cutworms *Agrotis* spp. and *Spodoptera* spp. are not spared.

PLA Sleeves

You see and hear it everywhere: horticulture also needs to become more sustainable. That is why Koen Pack has added some 100 per cent biodegradable sleeves to its standard range. These sleeves are made of a durable and naturally degradable material. They are printed with water-based ink which is better for the environment.

What are the advantages of PLA (Poly Lactic Acid)?

This material is not made of fossile fuels, in contrast to traditional plastics. These sleeves are made from renewable sources like sugar cane and corn. Because these sleeves are biodegradable, they can be composted after use. The consumer can simply throw the sleeves into the green waste bin together with the leaves. It is 100 per cent industrially compostable.

TROLLEY M2

The UNI-TROLL Trolley M2 is designed to carry two 600 x 400 millimetre ISO modular boxes or plastic crates per shelf level.

Underneath, two swivel and two fixed Ø125 millimetre castors ensure easy maneuverability, and the strong and durable 40 millimetre PUR tread ensures noise-reduced rolling. Eight post profiles and four post extenders can be placed safely in the trolley base frame. This protects the posts from being damaged and makes them easy to handle.

A Trolley M2 frame can also be placed on the top of the posts and you can take advantage of having a double-layer trolley load for the full truck height on long-distance transportations. Trolley base frames can be stacked on top of each other to reduce cost when empty trolleys are returned.

Measures and capacity

The Trolley M2 base frame is 891 x 616 millimetre and the height from ground level is 270 millimetre. The inside length is 815 millimetre.

Its unloaded weight with posts is 47 kilogram (base frame 25 and posts in total 22 kilogram). The trolley's carrying capacity is 400 kilogram SWL (Safe Working Load).

When stacked on top of each other, the stacking height of the first layer is 270 millimetre. When stored empty, twelve base frames can be stacked on top of each other to reach a height of 2580 millimetre.

Shelves

Trolley M2 shelves are available in three different variations:

The Shelf M2 PPGF is a plastic version that carries 40 kilogram UDL (Uniform Distributed Load) and is stackable to reduce the volume when returned empty. Its unloaded weight is 4.7 kilogram. The material is impact-resistant and in a new design with shock-absorbing high-tensile steel rods.

The Shelf M2 PWS is the plywood stackable shelf version, which can carry 60 kilogram UDL. Its unloaded weight is 3.9 kilogram.

The Shelf M2 PW is the plywood non-stackable shelf version, which can carry 60 kilogram UDL and is placed in the posts when returned empty. Its unloaded weight is 3.7 kilogram.

Treasure Island Sweet potatoes

Thanks to the collaboration and concept development by FitzGerald Nurseries and great breeding work at Louisiana State University Agriculture Center a unique range of sweet potato varieties has been developed which combines the values of the ornamental sweet potato varieties with those of the commercial agricultural varieties.

The roots of the Treasure Island sweet potato varieties are edible and compare favorably in harvest and culinary delight to the commercial varieties. The assortment consists of five varieties named after islands of French Polynesia in the South Pacific: Manihi, Makatea, Tatakoto, Tahiti and Kaukura. This provides an interesting backdrop and education of these forgotten exotic islands.

With the Treasure Island Sweet potatoes you can create a garden paradise of colour on your balcony, patio, conservatory or pergola throughout the summer and when harvest time comes in the autumn you can create some lovely sweet dishes for your family and friends. Did you know that also the leaves are edible and can be used in colourful summer salads, stir fries or fresh smoothies? They are also very healthy through their contents of Vitamin B, Beta-Carotene, Iron, Calcium, Zinc and Protein as well as other bio-actives.

The foliage colour can be green, golden or purple, the leaf shape varies from heart shaped to maple shaped to finger shaped. The roots vary from white to orange to purple both for the root skin and the flesh colour without losing the delicious sweet taste of the popular sweet potatoes.

Young plants will be produced for sale in Europe under license only by FitzGerald, Graines Voltz and Histhil.

ISAL

The ISAL logistic platform has been developed for the control and handling of logistic processes and activities. The ISAL framework is the frame for the ISAL platform and provides, among other things, communication with the (SQL) databases and communication with the (web) services. The framework also provides wizards for the purpose of design and configuration, user administration, Programmable Logic Controller (PLC) logging and communication with third-party PLCs.

ISAL CTS

The base module is responsible for container management in a more-or-less automated container yard area.

ISAL Tray Transport System (TTS)

This module can be used to control an automated tray delivery system for the control and visualization of the delivery process, by which order information can be entered manually or communicated via the Enterprise Resource Planning (ERP) connector from a higher-level order system (ERP) to ISAL (Manufacturing Execution System (MES)/Supervisory Control and Data Acquisition (SCADA)).

ISAL Potting

With this module, an automated potting up process can be controlled to achieve trusted batch registration at container level. For the implementation of this module, communication between the potting up robot and the container system must be possible.

ISAL Spacing

With this module, an automated spacing process can be controlled, making trustworthy batch registration at container level possible. For the implementation of this module, communication between the pick and place robot and the container system must be possible.

ISAL Dashboards

This module provides (BI) reporting capabilities on the production data stored in the ISAL, as well as the display of KPIs from machine performance.

Wireless soil moisture probes

Measure soil moisture completely wirelessly with the single-depth soil moisture probes. Probes take hourly measurements and are suitable for all soil types. Access data via the free Sensoterra app, available on mobile or desktop.

Get 24/7 insights into what's happening in your fields, from anywhere, with data accessible at your fingertips.

Built for the field, the probes have a simple, rugged design, measuring at depths of 15, 30, 60, and 90 centimetre, are suitable for all soil types, and measure at 99.5 per cent accuracy. Each probe comes with LoRa connectivity for a lifetime of three years, and a one year product warranty.

Installation is quick and easy, requiring a smartphone, a probe, and a rubber mallet. After creating your free Sensoterra account, scan the probe's QR code into the app, set the soil type, and hammer into the soil.

The Award Winning Vertical Planter For Green Walls

The Vertical Planter System is a self watering wallplanter. It is 46 centimetre long. Plants can be placed in their pots (up to 12 centimetre) or planted directly into compost using the planting tray.

The roots are kept constantly damp by the reservoir of water in the base. Running an irrigation pipe along the top row of planters, the water flows into them and then when the reservoir is full overflows to the one below.

The planters are designed to be easily applied to walls in a variety of methods. They can be clipped securely onto 50 millimetre welded mesh or screwed onto vertical or horizontal wooden laths.

Designed to be spaced 20 centimetre above each other leaves plenty of space for plants to grow and hide the planter. This product has already won two awards. Made, like all products from 90 per cent recycled consumer plastics.

For a more natural life: The new Floragard line of organic products

Delicious, aromatic, fragrant, acidic, all-round, vitalizing - these are the new organic soil mixtures by Floragard Vertriebs-GmbH. With this absolutely new approach at POS you will catch your customers' attention. Indoor or outdoor, ornamental plants, woody plants and lime-sensitive plants, herbs and vegetables – these soil mixtures, which are unique with respect to appearance and composition, address any application in natural gardening.

Floragard's decades of experience in the area of professional horticulture are the basis for the development of these mixtures. Flora Veggie-Power, the new fertilizer, meets the demands of many ecologically aware home gardeners who ask for a vegan soil. The Floragard research proves that the organic compositions provide for healthy growth, beautiful flowers and delicious fruits.

Turfquick - Winner of the Garden Product of the Year 2019

TURFquick® is a biodegradable textile that facilitates and streamlines grass sowing, and won the Garden Product of the Year Award 2019, the Elmia Garden Award.

The product is easily rolled out and cut to the desired size. The mat contains seeds and fertilizers and the textile keeps them in place and prevents erosion of soil mass and is suitable for planting in difficult places, such as flat surfaces.

Within two months the carpet has broken down and there are no traces of the textile left. The product is suitable for both private and public environments.

The idea for his product came to Håkan Isak Yilmaz after a failed project at home when he was going to plant a new lawn. He then developed a machine prototype and started manufacturing in his own factory in Nynäshamn. "The Elmia Garden Award is an award that proves that we have done something good for the environment, the garden industry and society. After 6 years of work and great ambitions, it has finally produced results. I feel proud and happy about my stubbornness and the prize is proof that you can achieve your dreams," says winner Håkan Isak Yilmaz.

Happy with Calla

Elegant shapes, clean lines – Calla offers ample inspiration for a mindful moment in the madness of modern times and offers nothing but flowering, empowering happiness. The excellent reputation of this flower goes back to the Romans and Greeks in ancient times, who saw in Calla a gorgeous symbolic chalice for toasting to life.

Life is good

Calla is still seen as the bringer of happiness. It is a symbol for finding comfort and joy in small things: a fresh cup of coffee, a nice gesture, a sunny day, exchanging a smile with a passing stranger and all other things that make life a bit more beautiful every day.

Colour your day with Calla

The good vibes of Calla become even stronger when you add the magnificent colours of this flower. Red for love, pink for new beginnings, orange, yellow and green for joy, purple and black for a bit of drama and white for serenity and pureness. There are even bicolour callas, just in case it is impossible to choose. Lovely to get and amazing to give: there's nothing like sharing happiness.

Mondi Plants is going Green

Mondi is the nickname of the founder and owner of the outdoor ornamental Plant Nursery in Pistoia, Italy, where he began as a local producer in 2000. Over few years and after a fast growth, thanks to an agile and versatile organization, Mondi Plants began to export to the French market and soon after steadily settled on all European and Middle East market. The company supplies Shrubs, Climbers, Hedging plants, Conifers, Roses, Trees, Topiary, Bamboos and small plants.

Thanks to the experience acquired as a Bamboo Production leader, Mondi recently sets a new advanced production line for Potting and Mulching small size containers and already count a steady production of hundreds of thousands of pots in several sizes in a wide range of plants.

The choice of an advanced system integrated with Biodegradable Mulching is giving unexpected results, the production suppressed most weeds, improves soil texture and helps soils retain moisture in summer.

Pulp-Tec plantpot - plantable and compostable

Pulp-Tec-pots are made from controlled raw materials of the wood and paper industry in the EU. In terms of processing in potting machines or other machines, the pots are to be processed technically in the same way as conventional plastic pots. Pulp-Tec pots can be planted and can be kept for about one year in the culture, outdoors, and can also be disposed of in house compost. With the Pulp-Tec pots that can be planted, packaging fees can be saved and you reach a better CO2 balance for yourself and your customers.

Carry Packs

The plastic plant packaging ensures that your plants are displayed at their very best in the shop. Even when the plants are packed in plastic, the transparent material and high-quality packaging ensure that they are displayed in a way that does justice to the appearance of the plants themselves.

Carrypacks

Voges Verpakking has developed a carrypack design for large plants, allowing you to deliver the plant complete with its pot. This is ideal for cacti in particular, as it is a way for you to protect customers and other items in the trolley from the sharp spines of the cactus. These types of plant packaging also allow you to make combinations, you could package three different cacti together, for example.

Smart Placing Robot, the 'artificial hand'

This intelligent robotic arm picks up the plants from the WPS carrier system fully automatically and places them at high speed in trays that are automatically supplied. The 'artificial hand' protects the plants against damage.

This smart robot is your best worker. It never gets tired, it is never sick, it has an excellent work capacity and works with a high degree of accuracy. What's more, you know exactly what your output will be, making your business processes more transparent and more predictable.

Kalanchoë grower KP Holland has taken the packing robot already into use.

[Watch the video](#)

Example of usage

Below is an example of the capacity of this smart robotic arm, based on an actual customer case. All WPS robots can, of course, be customized to suit your situation.

- | Capacity: 1,500 plants per hour
- | Pot size: 10.5 centimetre
- | Plant weight: 350 gram
- | Tray width: 285 to 385 millimeter
- | Tray length: 350 to 610 millimeter

Sustainable range: Recycled glass made in India

As part of Dymak's focus for 2020 on developing more sustainable and environmentally friendly products and accessories for its customers, Dymak has turned towards India as a sourcing destination. Dymak's glass collection is 100 per cent recyclable and can be recycled perpetually.

Each of Dymak's glass containers in their 2020 collection is artfully hand-crafted from recycled glass. They are a beautiful sustainable and eco-friendly accent décor to any space. Having worked with Indian manufacturers for over a decade, Dymak has formed long lasting collaborations and has also offered new opportunities for local glass blowers and their communities in Northern India.

Codema's mobile gutter system

Codema has, based on its knowledge and experience, developed an advanced automatic moving gutter system for fresh lettuce, herbs, micro vegetables and baby leaves.

The moving gutter system optimizes the harvest of the crops. The system can be adapted to the needs of the customer. Grower Meier Brothers explains: "Lettuce harvest is about four to five times higher with NFT." This system is more hygienic and saves water during cultivation and also during the cleaning of the lettuce for sale. The production process can be automated, which saves labor costs. Moreover, the product has a longer shelf life because the lettuce plants are harvested and sold with the roots attached. NFT provides a good return on the investment."

Codema has tested the system, thoroughly. "Our customers can now count on a predictable, reliable harvest 365 days per year. We currently have different types of lettuce systems available: traditional banking systems, floating lettuce and (semi-) automated moving gutter systems."

3GG Gear Motor

Introduction of 3GG Gear Motor

1. The failure rate of the limited switch is reduced to 5 ‰ from 5%.

At present, the most common quality problem of the gear motor is the damage of the limit switch control system. The main reason is that the self-locking performance of the gear motor fails to be qualified and the braking distance is too long. The statistical results of advanced gear motors show that when the braking distance is less than 10 mm, the failure rate will be greatly reduced.

In addition, it is predicted by the engineers of world important users that the braking distance of 3GG gear motor is less than 5 mm (5.2 rpm) and the failure rate is reduced to 5 ‰ from 5%.

2. Self-locking performance is excellent, to meet the high precision window system.

3GG adopts the last stage worm self-locking transmission system, which greatly improves the self-locking performance. Even the braking distance of the of 5.2 rpm gear motor (usually 2.6 rpm) can reach less than 5mm, which fully meets the requirements of high-precision windowing system and prolongs the service life.

3. Adding overload protection and power phase loss protection function.

3GG gear motor adds overload protection and power phase loss protection functions to the limit switch control system. When the three-phase power supply becomes two-phase, it automatically stops. When the load exceeds 1.5 times the rated load, it also automatically stops. After troubleshooting, the motor runs again, thus greatly reducing the number of after-sales service.

4. Adding the manual opening and closing device for power failure.

In the animal husbandry industry, when the windows are closed, the indoor temperature rises rapidly if there is power failure, which affects the growth of indoor poultry or causes a large number of deaths. Manual devices are now added, which when the power is off can be operated manually to open windows or to draw curtains to ensure the normal operation of livestock houses or greenhouses.

GC WiFi

The light recipes of this grow light are controllable by GC Signal. The GC WiFi offers even more options for customisation through pre-set and user defined operating modes.

It is also possible to simulate sunrise and sunset or to control the distribution of light in real time – all conveniently with the Greenception App.

The integrated five light channels make this Greenception product unique.

With these varied possibilities, plants can not only be compressed: Colour, flowering time, active ingredient and vitamin content as well as taste can be influenced in a targeted way.

At the heart of each cluster is the highly efficient full spectrum COB chip, which is complemented by eight smaller SMD chips.

The COB chip emits a light that the human eye perceives as white. In this way you can observe the plant without additional lighting and detect diseases or pests earlier.

Area of application

The GC WiFi is a compact LED module for grow boxes up to 75 x 75 centimetre. Due to the individual light recipes with their many options and the control via GC Signal and App, this grow light is a professional solution for demanding users.

Phormium cookianum 'Blondie' PBR

Key Features

- | Unique weeping plant habit similar to a *Chlorophytum*
- | Fine narrow long variegated foliage
- | Outstanding container specimen

Characteristics

Hardiness: USDA Zone 8. (15 Fahrenheit or minus twelve degrees)

Foliage: Unique narrow weeping, cream and green variegated foliage

Habit: Tight clumping habit; weeping foliage give a unique distinctive look. 0,90 x 0,60 metre (at maturity)

Culture: Best grown in part shade; feed regularly with high nitrogen

Additional Comments: Plants will exhibit best color when grown in part shade and fed weekly with a well balance fertilizer high in trace element. Remove old foliage at the base and keep in active growth. Plants will loose color with age if not tended correctly.

Uses: Specimen containers, borders, mass landscape planting

Orbit

The Orbit, a new and innovative solution from ARaymond Agriculture was developed specifically for supporting trees during the first period in the ornamental, olive & nuts nurseries.

It allows firmly attaching the young tree with the tutoring bamboo stick and adjusting the grip according to the development of the trunk. The Orbit's design of the belt ensures a solid fastening while avoiding stress and pressure on the tree to prevent trunk damages and the appearance of marks. Together with the reopenable closing system and the adjustable feature, the length of the belt can quickly be modified and thus used throughout the entire nursery time.

The Orbit can be removed and reused several of times.

High-end handheld meters for pH & EC value of the 200 series

MMM tech support GmbH & Co KG presents for the first time the new handheld readout devices of the 200 series for pH & EC value and dissolved oxygen from the Japanese manufacturer Horiba.

This completely newly developed generation of instruments is ideally adapted to the harsh operating conditions in agriculture and horticulture: Impact-resistant polycarbonate housing, waterproof to IP 67 even with electrodes connected, and an LCD display with backlight that is easy to read even in poor lighting conditions. In addition, all devices of the new 200 series have a built-in data memory, a diagnostic function for the connected electrodes and some models are equipped with a real-time clock and date/time stamp for GLP conformity.

Single channel pH and EC, dissolved oxygen, dual channel pH and EC and pH and dissolved oxygen combination meters are available. The two-channel meters allow both electrodes to be connected at the same time and to switch between the pH and EC values.

70.200 Secure & More Gel knee pad

Chaps & More is presenting the revised model 70,200. This comfortable gel safety knee protector, which has always helped people who already have a knee problem, has now been given a modified attachment so that the upper straps can no longer slip into the back of their knees. It has got a wonderful fit, which is enormously supported by the patented anti-slip material, which was processed in the upper area of the knee pads. This means that the knee pad no longer slips even when walking.

The knee pad, which is suitable for gardeners, cemetery gardeners as well as pavers and especially for those who have to work on their knees for a long time, gives the knee a lot of support and high stability due to the flat support of the knee pad.

For work on sensitive soils or on grave edges, the cap can still be easily removed using the Velcro fasteners.

Chaps & More also specializes in waterproof arm and leg protection, aprons and gaiters, which will also be presented.

Jumbo Jumbo Yellow - the crispy touch

Yellow, yellow and yellow again: The Jumbo Jumbo Yellow has remarkable big flowers with an intensely bright yellow colour and a heart that turns into orange pollen when the plant gets older. The unique structure of the 'crispy paper like' petals will grab your attention straight away. Its easy to grow, lasts long and blooms early. Insider tip: The flowers can be harvested to use as perfectly dried flowers or fresh potpourri.

The Jumbo Jumbo collection puts a smile on your face right away when you touch it for the first, second and even third time. Jumbo Jumbo is a collection of Xerochrysum (Bracteantha) with very big and long lasting flowers and a unique 'crispy' structure that reminds you of thin paper. There are multiple Bracteantha on the market but the Jumbo Jumbo variety is way stronger, has better branching and is earlier blooming. In addition, it is very easy to propagate and to grow and it has a strong garden performance.

Basewell™ and GreenGuard Poinsettias

Dümmen Orange launches Basewell™ and GreenGuard Poinsettias.

Basewell™

In the Innovation Kitchen visitors can experience the innovative and sustainable ways of working. A lot is going on in the kitchen, Dümmen Orange officially presents Basewell™ for the European market with trial packages for pelargoniums. Basewell™ is a new product form produced at off-shore farms that combines the benefits of unrooted cuttings and rooted cuttings. It is more mature than an unrooted cutting, with visible root development making it possible to plant directly into a finished container.

Basewell™ is fast and efficient to transplant with no losses. The rooted cuttings respond quick after transplant and grow uniformly. Basewell™ allows growers to significantly reduce labour and reduce propagation greenhouse space. Basewell™ allows growers to adhere much closer to their planned schedules by further eliminating the variables in the propagation processes and delays in liner to production transport processes.

GreenGuard Poinsettias

In another part of this booth, Dümmen Orange presents its new sustainably grown poinsettias, the latest result of its GreenGuard protocol ('Minimal Chemicals, Maximum Quality'). With an eye for innovation and sustainability, Dümmen Orange is developing a future in which the level of chemical pesticides on its cuttings is reduced significantly to protect people and the environment. In addition, this program allows the company to fulfill customer requests as the demand increases for sustainable products grown with fewer chemical pesticides. The clear path to meet these production demands is to follow the principles of Integrated Pest Management. More products will follow soon.

Hydrangea RUNAWAY BRIDE 'Snow White'

RUNAWAY BRIDE® is an entirely new class of interspecific Hydrangea hybrid that flowers not only at the end of the stems, but also from all lateral buds from the previous season.

The lacecap inflorescences are bordered with large, elegant sterile florets in pure white, often flushed with pink during cooler weather. Due to the unique flowering habit and garland-like stems, this type of hydrangea can be grown into totally new product forms – in addition to standard pots/containers, RUNAWAY BRIDE can also be grown in hanging baskets, on trellises, pyramids, columns and more.

The unbelievable profusion of flowers, its elegant beauty – and the fact that this variety has proved to be reliably remontant all summer long – are attributes that will make this variety very popular with home gardeners. The vigour, elegant spreading plant habit and good hardiness make it for a fantastic garden and container plant.

New Imara® from Syngenta Flowers delivers breakthrough in impatiens walleriana

New Imara® from Syngenta Flowers delivers breakthrough in impatiens walleriana

- | More resistant to downy mildew than ever before
- | Imara is bringing back the gardener's favourite plant
- | First to market with new and improved impatiens walleriana

Syngenta Flowers is proud to announce the return of impatiens walleriana with the new series, Imara®. Launching in the U.K., Germany, France and the Netherlands, this breakthrough impatiens walleriana is stronger and more resistant to downy mildew than ever before.

Since the widespread outbreak of downy mildew in 2011, the impatiens walleriana market has drastically declined. However, Imara® offers disease resilience so growers can bring this popular plant back into production and retailers can reinvigorate the market by putting a consumer favourite back onto shelves.

"Syngenta is a research and development company. We do innovation, so developing a new generation of impatiens walleriana has been important to us," said Michael Kester, Global Head of Syngenta Flowers. "We are very excited to be first to market with this breakthrough and bring back a product that will delight consumers with outstanding performance in sun, shade, rain or shine. We know this will translate to a strong, sustainable consumer demand to benefit retailers and growers."

In addition to its resiliency, Imara® offers growers a reliable, low-maintenance and economical plant for greenhouse production. It is robust and durable, holding up well during transport so plants stay in top shape when moved to retail.

A powerful trio against fungus gnat larvae

Almost every area of horticulture is familiar with fungus gnats and their larvae. Especially seedling producers are afraid of them. Fungus gnat larvae are not choosy for roots, whether poinsettia, bedding and balcony plants, herbs, vegetables, hardwood cutting or herbaceous perennials, their diet includes all those roots. Chemical crop protection can hardly provide any possibilities for action. Therefore, it is great that biological plant protection can offer good alternatives to cultural and biological techniques (such as yellow catchboards for monitoring or drought stress).

The powerful trio consists of the nematodes *Steinernema feltiae*, the predatory mite *Hypoaspis miles* and a BTI. *Steinernema feltiae* are threadworms that are being poured into the plants. They are either contained in clay granules and then dissolved in water or they are poured as ice nematodes. *Hypoaspis miles* lives on the soil and, besides fungus gnats larvae, also eats thrips and springtails.

They are being scattered onto the plant substrate in the carrier material, a mixture of vermiculite and soil. *Bacillus thuringiensis israelensis* (BTI) is being poured. The methods described are used preventively in the first week after seeding, pricking, plugging or planting and should be, according to the requirements of the plant culture, pursued continuously.

Grafted Hot Peppers

Hishtil's grafted hot pepper plants are sharp flavoured, vibrant and beautiful and help increase yields.

The product list of grafted hot pepper plants includes the following types:

- Capsicum hot pepper 'Magnum' (Habanero) Grafted
- Capsicum hot pepper 'Maya' (Habanero) Grafted
- Capsicum hot pepper 'Touro' (Jalapeno) Grafted
- Capsicum hot pepper 'Budapest' (Hungarian) Grafted
- Capsicum hot pepper 'Fire Flame' (Chili) Grafted
- Capsicum hot pepper 'Dorset Naga Red' (Morch) Grafted
- Capsicum hot pepper 'Jamaican Yellow' (Scotch) Grafted
- Capsicum hot pepper 'Big Devil' (Chili) Grafted

Like other grafted vegetable plants, grafted hot peppers have proven to be superior performers, having robust growth, longer fruiting and higher resistance to soil disease. Benefits outweigh costs when factoring in an increase in yield and a reduction in chemicals for disease prevention. These advantages make them clear favourites for commercial growers and home gardeners alike.

Pot Roses with enchanting Fragrance

The Queen of Pot Roses – the international acknowledged rose breeder Rosa Eskelund from Roses Forever – presents a brand-new series of long-lasting fragrant pot roses with large flowers.

Pot roses with fragrance are very difficult to breed, and when you add long life of minimum three weeks and large flowers, you really have a challenge ahead of you.

Nevertheless, rose breeder Rosa Eskelund took up the challenge and after ten years of breeding she is now ready to present four amazing varieties with large fragrant flowers and a beautiful dark green foliage. All four new varieties have a very pleasant fragrance with large long-lasting flowers and are for both indoor and outdoor use, so Rosa Eskelund, who already has been breeding a long line of international bestsellers sold under the brand names Infinity® Roses, Roses Forever® and Love Forever®.

Four new varieties

The new varieties will be marketed under the brand name *Love Fragrance Forever*. The new varieties are all ready for the market from March 2019.

Stop and smell the Roses

Rosa Eskelund is a breeder with passion for her roses. That is also why her new fragrant pot roses will be presented under the slogan *Stop and smell the Roses*. "I heard this expression about *Stop and smell the Roses* some time ago. It is so true, because we all live busy lives, and it is important sometimes to "*stop and smell the roses*" and see our lives with a deeper appreciation of the world around us. It can help us to slow down and be aware of all the little things that makes life so beautiful. It is more than ever important to take a break and be present in the moment; otherwise those moments will pass you by", says Rosa Eskelund.

Hyperion™ Greenhouse LED grow light

Plessey Semiconductors have specifically designed the Hyperion™ grow light to deliver greater returns for commercial growers. The Hyperion™ grow light can work alongside or can replace high pressure sodium grow lights. With Hyperion™ you need less units for any given lighting installation than with competitor LED grow lights. Being 1:1 equivalent with existing 1000w and 600w sodium grow lights makes Hyperion™ easy to install and to use for growers, installers and greenhouse builders.

Key features

Up to 1800 µmol/s and 1000 µmol/s light output options

Equivalent to 1000w and 600w sodium grow lights

Up to 40 per cent energy saving versus sodium

Up to 3.0 µmol / joule efficacy (after driver and optical losses)

100 per cent LED or hybrid with HPS installation

Key features continued

IP66 rated for full pressure power wash cleaning

IP68 rated fan on Hyperion™ 1750. Dust tight and prolonged immersion

Range of proven spectrums for different applications

Tailor-made spectrum to suit grower requirement

Low shading and installation costs

Five years guarantee/ 25,000 hours

Leasing options

Benefits

Fewer units required per install than any competitor LED fixtures

Less overall shading than any competitor LED fixtures

Lower installation costs

Install on existing trellis to avoid extra c-profile cost and shading

Greater flexibility on lighting design and positioning

Even light distribution possible between 5 metre poles

Options

Reflector accessory to ensure uniformity at the edge of installations

AS 1200 - new spraying procedure for plant protection

With the AS 1200, Birchmeier Sprühtechnik AG has developed a new device with air-supported spraying technology. The device combines the benefits of conventional nozzle spraying with a controlled air stream. As distinguished from a mist blower it uses the very latest electronics and rechargeable battery technology.

At the heart of the AS 1200 is an easy-to-use, portable blower with an electronic control system and an integrated spray nozzle. Spray solution is fed into it at a pre-set pressure via a hose from a rechargeable sprayer and mixes optimally with the air stream. The blower power can be set to various levels depending on the application. From a gentle breeze when working next to a wall of leaves, to a powerful hurricane, when working at a distance of ten metres or more - everything is possible. With this new process, users can penetrate existing plants better. The AS 1200 is quiet and produces no exhaust gas.

The blower is designed as an additional device and works together with a sprayer from Birchmeier's «Accu-Power» line. These rechargeable devices developed by Birchmeier in recent years have received a number of international prizes for innovation. Anyone who owns a rechargeable backpack sprayer from Birchmeier can combine it with the blower. However, the blower requires an additional high-performance rechargeable battery. This is designed to allow several hours' spraying depending on the blower's power setting. The latest electronics ensures straightforward, reliable operation. This device too is "Made in Switzerland".

Spical Ulti-Mite: New sachet improves spider mite control

Following the success of a newly patented packaging concept by Koppert Biological Systems, [Spical Ulti-Mite](#) is now available in a high-tech foil sachet that ensures consistent performance in variable climatic conditions. Compared to other regular paper sachets in the market, the Spical Ulti-Mite foil sachets perform up to three times better. Trials have proven that Spical Ulti-Mite consistently delivers higher numbers of predatory mites under challenging conditions.

Extensive research has resulted in a sachet that creates a better environment for the predatory mite to build up its population. The superior quality of the foil ensures the breeding system is better protected against environmental conditions that may affect the mites emerging from it. The sachet is narrower and slightly longer and gives the mites the very best conditions to develop even more swiftly and strongly.

Spical Ulti-Mite, which is widely used to control spider mite in a variety of greenhouse crops, can now also be applied to outdoor crops such as citrus and grapes. With the introduction of Spical Ulti-Mite, Koppert aims for more security for both grower and crop.

The new Spical Ulti-Mite sachets can be disposed of together with the crop waste. The sachet is made of a newly-developed foil that conforms to the required industrial compostable standards. In addition, Koppert Biological Systems has reinforced the hook from which it can be attached to make it even more robust.

EU-plant passport - marking right onto the plant pot

The alphaJET continuous inkjet systems are ideal for direct printing on pots, trays and more. The plant passport is printing directly onto the trade goods. The shape and size of the plant pots may be different. With the alphaJET, the font and size can be freely selected.

Advantages of direct marking:

- | low running costs
- | flexible in the design of the print image
- | easy to integrate into existing processes
- | no warehousing costs

For the plant passport on the merchandise, the areas marked with the letters A, B, C and D must be clearly identifiable. The size of the plant passport, the font and the font size can be freely chosen. It must be legible to the naked eye. In addition, the plant passport must be visible at a glance.

Mosswool

Mosswool is a sustainable growing slab for vegetable cultivation. Mosswool slabs are made of sphagnum moss, which is harvested with a patented ecological method.

Due to the organic raw materials, Mosswool can be easily locally composted with the crop residues or recycled after use, which can minimise disposal costs.

The greener side: Botanical by Scheurich

Botanical by Scheurich now expands the popular Urban Jungle, with the new Tropical Garden and Palm Garden, making the presence of green plants once again a lifestyle choice with the feel-good factor guaranteed. The broad-leaved decorative pot designs appear realistic and are eye-catching a real recipe for relaxation. They are perfectly suited to the zebra plant (*Calathea zebrina*), monstera (*Monstera deliciosa*) or parlour palm (*Chamaedorea elegans*).

Green living knows no boundaries. A natural lifestyle harmonises wonderfully with Scandinavian design and transforms a classic, cosy atmosphere into the on-trend "Hygge", and everyone can use a little more of that! Botanical is available in sizes up to XL and makes greenery centre stage without compromises. Put on the floor, small urban-living gardens emerge, which create fresh air so that you can breathe and relax.

Pictures, pillows and blankets featuring leaf motifs as well as use of the colour sage green, co-ordinate well with these new cover-pots. Interesting arrangements can be created by combining Tropical Garden and Palm Garden with the popular Scheurich cover-pots in Panna and Anthracite.

To keep the green oasis dry, these high quality cover-pots are manufactured from 100 percent waterproof ceramic.

Heavy duty pedestals

Especially for large, heavyweight plants, Wagner has developed three heavy-duty versions of the top-selling series "plant stands". Placed solo, in rows or in groups, the new "heavy duty pedestals" in sizes "L", "XL" and "XXL" enable the attractive presentation of "botanical heavyweights" both indoors and outdoors.

In addition to their aesthetic effect, the sturdy, weatherproof powder-coated heavy-duty plant stands are also real problem solvers: They protect valuable potted plants such as palms or olive trees from ground cooling, waterlogging and pests and contribute to healthy growth by optimum air circulation under the planters. In addition, the raised position of the planters provides a comfortable working height when caring for the plants and prevents direct contact with the ground. The effect: lawns remain protected, damage caused by mould stains, limescale or waterlogging on tiles, stone or wooden floors is prevented.

Thanks to their sturdy steel construction, all three plant stand innovations have a load-bearing capacity of up to 200 kilogram. With a height of 25 centimetre each and "L", "XL" and "XXL" diameters of 38, 48 and 58 centimetre, they are the ideal base for all common large to very large planters. Stable adjustable feet with nubbed anti-slip underside ensure wobble-free and tilt-free positioning, even on uneven surfaces.

Andes Amaryllis®: New wax amaryllis

Agro Floral Peru is delighted to introduce their new brand and line of wax amaryllis Andes Amaryllis® to the international market.

The wax amaryllis are produced in their own fields in southern Peru, where they can obtain the best quality bulbs, with large size, and always a reliable and high-quality blooming.

The team of artisans produces the wax amaryllis models one by one, with dedication and craftsmanship of the highest level.

Wax amaryllis are natural flower bulbs that are able to sprout and bloom without the need to be planted or watered. The flower buds, water and energy that the plant requires to bloom, are already inside it. The use of a delicate layer of wax protects the bulb from dehydration, and allows a high-quality blooming.

The dedicated team in Peru grows, harvests and prepares each bulb with the necessary care to guarantee a healthy, reliable product that brings joy and beauty to whoever receives it.

Andes Amaryllis® is always innovating and testing different varieties and colours of flowers, which deliver a wax amaryllis with perfect flowering.

Andes Amaryllis® has its own production of amaryllis bulbs in the south-central area of Peru, taking advantage of the privileged climate of the coast of the Atacama desert, and the water of the rivers that flow down from the heights of the Andes.

DH Licht presents the xFactory from ROKO Farming

DH Licht GmbH is known for innovative plant lighting in a wide range of applications and also has the right products for vertical plant cultivation.

For the first time the company presents a vertical farming test station, the xFactory by ROKO Farming. With it, various growth parameters for diverse crops can be analyzed very easily and quickly. Among other things, it is equipped with spectrally adjustable LED luminaires from DH Licht GmbH and Polyponics® technology from ROKO Farming. This allows to test up to three different light spectra and up to four different irrigation methods simultaneously.

New and exclusive products

Hishtil Afula presents its new and exclusive products as well its latest varieties and timeless classics.

‡ **Rosmarinus officinalis 'Roman Beauty'?** - A culinary delight and a visual treat. Its gently arching stems are adorned with fragrant foliage, creating a gracefully cascading mound of lush greenery. In spring and early summer, it surprises with beautiful, rich blue flowers.

‡ **Scabiosa incisa 'Kudo Blue'?** - A magnet for bees and butterflies. Ideal for beds, patio containers and borders This hardy perennial offers a long season of colour, with delicate Lavender blue blooms adorning the plant from June to October.

‡ **Scabiosa incisa 'Kudo Pink '?** - An easy-to-grow, delightful compact scabious variety that graces your garden with its oversized, vibrant pink pincushion flowers throughout the entire summer.

‡ **Thymus mastichina Compact 'POMPOM'?** - Native to the wild landscapes of Spain and Portugal, this plant boasts broad and distinctive leaves. During the summer, it bursts into elegant white 'Pom Pom' shaped flowers. Suitable for both ornamental display and culinary uses. The compact 'Pom Pom' enjoys immense popularity among a variety of pollinators, such as bees, butterflies, and hoverflies.

‡ **Ziziphora clinopodioides 'High Mountain Mint'?** - Native to high mountain regions, this plant is a valuable addition to the Durabelo™ series, known for its resilience against dry conditions and extreme cold. During the summer, the High Mountain Mint graces up with delicate white and pink blossoms. Its remarkable medicinal properties include natural antibacterial effects, making it a valuable tool for extending the shelf life of products and preventing mold growth.

During the show, the company will also unveil Hishtil's new and exclusive sustainably designed catalogue for 2024 and its new 50th anniversary movie.

Cocopeat grow bags

Coco grow bags are technologically advanced growing mediums designed for hydroponic cultivation. These innovative bags are crafted with high-quality cocopeat, derived from coconut husks, and enclosed in durable co-extruded polypropylene (PP) material. The bags undergo UV treatment for a minimum of two years, ensuring their longevity and resilience in various growing conditions. Coco grow bags are specifically engineered to meet the needs of different crops, making them ideal for hydroponic systems.

Maintaining a balanced pH level and electrical conductivity (EC) is crucial for the success of hydroponic cultivation. Coco grow bags are carefully monitored to achieve the ideal pH range and EC, promoting healthy root development and efficient nutrient absorption by plants. The bags provide excellent aeration capacity, facilitating the proper exchange of oxygen within the growing medium.

Advantages:

- Efficient water retention for optimal moisture levels
- Reduces water wastage in hydroponic systems and compatibility with drip irrigation systems
- Facilitates efficient nutrient delivery to plants and ensures consistent and reliable crop production
- Pre-cut drain holes, planting holes, and dripper holes for easy installation
- Balanced pH and electrical conductivity (EC) for healthy root development
- Excellent aeration capacity for proper oxygen exchange
- UV-treated polypropylene material for longevity and durability

Plug & Play container solution to produce wood fiber as peat substitute

The Plug & Play (PnP) container solution revolutionizes wood fiber production with refining technology, offering a green substitute to peat. This highly efficient system can be adapted flexibly to a wide range of customer requirements and ensures reproducible and homogeneous fiber production with low maintenance.

This dynamic setup and the compact, mobile system allow fibers to be produced almost anywhere. Thanks to the Plug & Play technology, the system simply needs to be supplied with sufficient energy. Due to atmospheric refining, no steam is required for the process, ensuring cost-efficient and robust production.

The unique refining technology employed enables the adjustment of variable process parameters to influence both fiber morphology and specific energy consumption. Maintenance is seamless thanks to the refiner's swing door design for rapid plate changes. Additionally, the refiner serves a dual purpose, also functioning as a mixer for solids, liquids, and various additives, facilitating the coloring of fibers. Operating at temperatures ≈ 100 degree ensures compliance with the CMC2 classification under the new EU regulation for fertilizing products (EU 2019/1009). Furthermore, the mobile system supports rapid on-site repairs to minimize downtime and offers the option to revitalize the entire container in our specialized workshops during the "off-season".

Benefits:

- | Cost-efficient and eco-friendly operation in compliance with EU regulations
- | Location-independent production, adaptable to diverse raw materials
- | Minimal energy requirements
- | Operational simplicity thanks to quick implementation and limited personnel required
- | Mobile system enables rapid on-site repairs, minimizing downtime
- | Modular construction for tailored setups and optimized resource utilization

Codema's mobile gutter system

Codema has, based on its knowledge and experience, developed an advanced automatic moving gutter system for fresh lettuce, herbs, micro vegetables and baby leaves.

The moving gutter system optimizes the harvest of the crops. The system can be adapted to the needs of the customer. Grower Meier Brothers explains: "Lettuce harvest is about four to five times higher with NFT." This system is more hygienic and saves water during cultivation and also during the cleaning of the lettuce for sale. The production process can be automated, which saves labor costs. Moreover, the product has a longer shelf life because the lettuce plants are harvested and sold with the roots attached. NFT provides a good return on the investment."

Codema has tested the system, thoroughly. "Our customers can now count on a predictable, reliable harvest 365 days per year. We currently have different types of lettuce systems available: traditional banking systems, floating lettuce and (semi-) automated moving gutter systems."

3GG Gear Motor

Introduction of 3GG Gear Motor

1. The failure rate of the limited switch is reduced to 5 ‰ from 5%.

At present, the most common quality problem of the gear motor is the damage of the limit switch control system. The main reason is that the self-locking performance of the gear motor fails to be qualified and the braking distance is too long. The statistical results of advanced gear motors show that when the braking distance is less than 10 mm, the failure rate will be greatly reduced.

In addition, it is predicted by the engineers of world important users that the braking distance of 3GG gear motor is less than 5 mm (5.2 rpm) and the failure rate is reduced to 5 ‰ from 5%.

2. Self-locking performance is excellent, to meet the high precision window system.

3GG adopts the last stage worm self-locking transmission system, which greatly improves the self-locking performance. Even the braking distance of the of 5.2 rpm gear motor (usually 2.6 rpm) can reach less than 5mm, which fully meets the requirements of high-precision windowing system and prolongs the service life.

3. Adding overload protection and power phase loss protection function.

3GG gear motor adds overload protection and power phase loss protection functions to the limit switch control system. When the three-phase power supply becomes two-phase, it automatically stops. When the load exceeds 1.5 times the rated load, it also automatically stops. After troubleshooting, the motor runs again, thus greatly reducing the number of after-sales service.

4. Adding the manual opening and closing device for power failure.

In the animal husbandry industry, when the windows are closed, the indoor temperature rises rapidly if there is power failure, which affects the growth of indoor poultry or causes a large number of deaths. Manual devices are now added, which when the power is off can be operated manually to open windows or to draw curtains to ensure the normal operation of livestock houses or greenhouses.

Well-known MANKAR ULV spraying-systems have been re-invented

The well-known MANKAR ULV spraying-systems have been re-invented: There now is a new nozzle the R-model, which allows efficient application of biological herbicides and herbicide mixtures that need to be applied at a higher rate than traditional herbicides. To contain drift, the new "R-Nozzle" is equipped with a round spray hood with a diameter of 35 centimetre and is available together with the MANKAR Carry and Drive machines.

With the new R-nozzles for MANKAR-ULV sprayers and the BioMant-Flex, Mantis now offers three complete ranges of weed control solutions for areas of all sizes and for a variety of applications - with hot water, biological or traditional herbicides.

GC WiFi

The light recipes of this grow light are controllable by GC Signal. The GC WiFi offers even more options for customisation through pre-set and user defined operating modes.

It is also possible to simulate sunrise and sunset or to control the distribution of light in real time – all conveniently with the Greenception App.

The integrated five light channels make this Greenception product unique.

With these varied possibilities, plants can not only be compressed: Colour, flowering time, active ingredient and vitamin content as well as taste can be influenced in a targeted way.

At the heart of each cluster is the highly efficient full spectrum COB chip, which is complemented by eight smaller SMD chips.

The COB chip emits a light that the human eye perceives as white. In this way you can observe the plant without additional lighting and detect diseases or pests earlier.

Area of application

The GC WiFi is a compact LED module for grow boxes up to 75 x 75 centimetre. Due to the individual light recipes with their many options and the control via GC Signal and App, this grow light is a professional solution for demanding users.

Campanula Ambella® Pink: atmospheric and long-flowering

Give your garden, patio or house a colour boost with the brand new Ambella® Pink by Addenda®. This intense pink Campanula immediately makes your space warmer and more atmospheric, especially when you combine it with other Ambella colours. It is an easy-care plant that flowers almost all year round.

Ambella® Pink is a Campanula. This super strong plant originally hails from the Dalmatian mountains and is well-loved for its refined, bell-shaped flowers, bright colours and extra long flowering time. Already available in white, lavender and purple, Addenda® now presents a unique innovation in a stylish pink shade: Ambella® Pink. The deep pink flowers and compact, spherical habit of the new Ambella® Pink fits in perfectly with a more classic style. Think English garden or rustic living room. Indeed, Ambella® Pink looks just as splendidly outside as it does inside. More a fan of wild gardens or minimalist spaces? Ambella® Pink is a fantastic choice for these settings too. You could put it in a large, natural terracotta pot on the patio, for example, or choose a zinc container for a sleeker look. Another option is to plant Ambella® Pink in a border for really beautiful ground cover.

Ambella® Pink: Atmospheric and long-flowering

- | Matches the other Ambella shades perfectly
- | Blooms a couple of times a year
- | Needs very little attention
- | Does well inside and outside
- | Can withstand (freezing) cold temperatures

Phormium cookianum 'Blondie' PBR

Key Features

- | Unique weeping plant habit similar to a *Chlorophytum*
- | Fine narrow long variegated foliage
- | Outstanding container specimen

Characteristics

Hardiness: USDA Zone 8. (15 Fahrenheit or minus twelve degrees)

Foliage: Unique narrow weeping, cream and green variegated foliage

Habit: Tight clumping habit; weeping foliage give a unique distinctive look. 0,90 x 0,60 metre (at maturity)

Culture: Best grown in part shade; feed regularly with high nitrogen

Additional Comments: Plants will exhibit best color when grown in part shade and fed weekly with a well balance fertilizer high in trace element. Remove old foliage at the base and keep in active growth. Plants will loose color with age if not tended correctly.

Uses: Specimen containers, borders, mass landscape planting

Shades of Colour

When you get right down to it, gardens are really about colour. Colours can come from flowers, foliage, bark, pottery, furniture, fences and even artwork, but in the end it is all about colour. The gardens are meant to enhance our lives and to make our homes look better from the Curb. Colour can be soothing or exciting, it can be a riot or a river, it can be front and center or something much more subtle, but whatever our choices, colour is the goal.

These collections will turn your garden upside down. These colourful and diverse types of Tulips are available in six striking colour blends and offer your garden weeks of spring pleasure. These collections are now packaged in a coloured bag that matches the contents of the collection.

QTS 3 aecoQcube is a novel system for cultivating young plants in soil blocks

QTS 3 aecoQcube is a novel system for cultivating young plants in soil blocks, which have until now mainly been produced from black peat. Previous systems based on black peat may have certain disadvantages: they are heavy, easily become compacted, do not allow sufficient aeration of the rooting zone and, if they dry out, require rapid rewetting.

The new QTS 3 aecoQcube enables soil blocks with larger dimensions to be produced. This makes them suitable not only for propagating young vegetable plants, but also for young ornamental plants and for cuttings.

Soil blocks made using QTS 3 aecoQcube keep their shape very well and do not fall apart during processing. They are less compacted, containing more air that can be warmed and more oxygen for the roots.

They have good buffering capacity due to the balance between structurally stable white peats on the one hand, and more strongly decomposed peats that have good buffering properties on the other. This is optimised by the highly beneficial attributes of the special clay used. They have superior swelling capacity and shrinking properties to soil blocks based solely on black peat. The amplitude between dry and wet conditions is ideal for many crops. Soil blocks produced using QTS 3 aecoQcube will, even if they appear somewhat dried out, still have enough plant-available moisture without the blocks being too dry or too wet.

Soil blocks made with QTS 3 hold water very well, but are also good at allowing excess water to escape from the block. This results in shorter irrigation intervals for soil blocks produced with QTS 3 aecoQcube than for those made entirely with black peat.

A crop grown in soil blocks made from QTS 3 aecoQcube requires less plastic than a crop produced in trays.

Cultivation in soil blocks made of QTS 3 aecoQcube is, fundamentally, an economically sound solution, since no costs are incurred for trays. And, being lightweight for transport, it requires less cargo or freight space, thus cutting energy costs.

Jumbo Jumbo Yellow - the crispy touch

Yellow, yellow and yellow again: The Jumbo Jumbo Yellow has remarkable big flowers with an intensely bright yellow colour and a heart that turns into orange pollen when the plant gets older. The unique structure of the 'crispy paper like' petals will grab your attention straight away. Its easy to grow, lasts long and blooms early. Insider tip: The flowers can be harvested to use as perfectly dried flowers or fresh potpourri.

The Jumbo Jumbo collection puts a smile on your face right away when you touch it for the first, second and even third time. Jumbo Jumbo is a collection of Xerochrysum (Bracteantha) with very big and long lasting flowers and a unique 'crispy' structure that reminds you of thin paper. There are multiple Bracteantha on the market but the Jumbo Jumbo variety is way stronger, has better branching and is earlier blooming. In addition, it is very easy to propagate and to grow and it has a strong garden performance.

Technology for wood fiber production for all kinds of wood

The Bioextruder is a patented machine with a proven track record of over twenty-five years that is able to turn every kind of woody material into wood fiber.

The extrusion process exerts pressure and friction on the material resulting in a temperature increase up to 125 degree causing the steam explosion and the defibration of wood: this changes the physical structure of wood and eliminates bacteria.

The machine is robust, reliable and can process all kinds of woody feedstocks.

The wood fiber machine is easy and ready to use, has superb water and nutrient holding capacity, low salt content, neutral pH, mixes easily in growing media blends and does not need further treatments.

FiberCell introduces a new Biobased paper

The Biobased paper family combines different biobased fibers to create an environmentally friendly product with the degradation time desired by the customer. This is a paper with a broad range. It is used for propagation of a wide variety of crops. The universal paper contains physical holes that enable good aeration through media and allow perfect root penetration for optimum root development and high root biomass.

This new paper is thinner and lighter, yet strong. There is no glue needed and it is high efficient. Furthermore it has low environmental impact. It is applicable for fruits, flowers, herbs and leafy greens. Degradation time four to 14 months.

Basewell™ and GreenGuard Poinsettias

Dümmen Orange launches Basewell™ and GreenGuard Poinsettias.

Basewell™

In the Innovation Kitchen visitors can experience the innovative and sustainable ways of working. A lot is going on in the kitchen, Dümmen Orange officially presents Basewell™ for the European market with trial packages for pelargoniums. Basewell™ is a new product form produced at off-shore farms that combines the benefits of unrooted cuttings and rooted cuttings. It is more mature than an unrooted cutting, with visible root development making it possible to plant directly into a finished container.

Basewell™ is fast and efficient to transplant with no losses. The rooted cuttings respond quick after transplant and grow uniformly. Basewell™ allows growers to significantly reduce labour and reduce propagation greenhouse space. Basewell™ allows growers to adhere much closer to their planned schedules by further eliminating the variables in the propagation processes and delays in liner to production transport processes.

GreenGuard Poinsettias

In another part of this booth, Dümmen Orange presents its new sustainably grown poinsettias, the latest result of its GreenGuard protocol ('Minimal Chemicals, Maximum Quality'). With an eye for innovation and sustainability, Dümmen Orange is developing a future in which the level of chemical pesticides on its cuttings is reduced significantly to protect people and the environment. In addition, this program allows the company to fulfill customer requests as the demand increases for sustainable products grown with fewer chemical pesticides. The clear path to meet these production demands is to follow the principles of Integrated Pest Management. More products will follow soon.

Hydrangea RUNAWAY BRIDE 'Snow White'

RUNAWAY BRIDE® is an entirely new class of interspecific Hydrangea hybrid that flowers not only at the end of the stems, but also from all lateral buds from the previous season.

The lacecap inflorescences are bordered with large, elegant sterile florets in pure white, often flushed with pink during cooler weather. Due to the unique flowering habit and garland-like stems, this type of hydrangea can be grown into totally new product forms – in addition to standard pots/containers, RUNAWAY BRIDE can also be grown in hanging baskets, on trellises, pyramids, columns and more.

The unbelievable profusion of flowers, its elegant beauty – and the fact that this variety has proved to be reliably remontant all summer long – are attributes that will make this variety very popular with home gardeners. The vigour, elegant spreading plant habit and good hardiness make it for a fantastic garden and container plant.

Lawn-innovation DCM Mooslos Grün

Super fast to a deep green lawn without moss? CUXIN DCM has developed the right product for this purpose: DCM Lawn Fertilizer Mooslos Grün (Mossless Green), a plant based liquid concentrate with an innovative active formula.

With plant amino acids, nitrogen and iron chelate, the fertilizer provides the lawn with nutrients in two ways: The plant amino acids ensure direct absorption of the nutrients via the blades of the grass. This leads to a quick green colouring and gives the lawn a healthy and strong appearance within a short time. At the same time, the nitrogen contained supports the growth of the grasses via the soil and promotes the development of a dense and resistant lawn. A visible effect already occurs after two to three days.

A clear advantage of the fertilizer is also its indirect effect against moss. The unique active formula effectively displaces the moss within a few days and helps to prevent unsightly growth. The contained iron chelate does not leave stains on stones and paths.

The product is available in the sizes 1 L for 100 m² and 2.5 L for 250 m².

New Imara® from Syngenta Flowers delivers breakthrough in impatiens walleriana

New Imara® from Syngenta Flowers delivers breakthrough in impatiens walleriana

- | More resistant to downy mildew than ever before
- | Imara is bringing back the gardener's favourite plant
- | First to market with new and improved impatiens walleriana

Syngenta Flowers is proud to announce the return of impatiens walleriana with the new series, Imara®. Launching in the U.K., Germany, France and the Netherlands, this breakthrough impatiens walleriana is stronger and more resistant to downy mildew than ever before.

Since the widespread outbreak of downy mildew in 2011, the impatiens walleriana market has drastically declined. However, Imara® offers disease resilience so growers can bring this popular plant back into production and retailers can reinvigorate the market by putting a consumer favourite back onto shelves.

"Syngenta is a research and development company. We do innovation, so developing a new generation of impatiens walleriana has been important to us," said Michael Kester, Global Head of Syngenta Flowers. "We are very excited to be first to market with this breakthrough and bring back a product that will delight consumers with outstanding performance in sun, shade, rain or shine. We know this will translate to a strong, sustainable consumer demand to benefit retailers and growers."

In addition to its resiliency, Imara® offers growers a reliable, low-maintenance and economical plant for greenhouse production. It is robust and durable, holding up well during transport so plants stay in top shape when moved to retail.

Sustainability made accessible

LiveTrends Design Group believe in providing the very best quality Danish-grown houseplants, whilst also being mindful of the impact on the environment. The promise is to provide the best quality, Danish-grown houseplants in 100 per cent peat-free soil so you can enjoy the beauty of nature in your home without harming the planet.

As the only producers in Denmark of peat-free plants, LifeTrends Design Group is proud to lead the way in sustainable gardening. Peat, while traditionally used for its moisture and air retention qualities, is extracted from peat bogs, fens, and marshes, where it takes thousands of years to form. This makes it a non-renewable resource and contributes to the release of carbon dioxide, accelerating climate change?.

The commitment to sustainability goes beyond just peat-free compost. The company unstand the challenges gardeners face in transitioning from peat, which is why the products are designed to offer consistency and reliability. LifeTrends use innovative materials like wood and coconut fibers, which not only perform as well as peat in all areas but are also more environmentally friendly?.

?

Moreover, the plants are grown without plastic grower pots, further reducing the environmental footprint. This aligns with the growing demand for eco-friendly gardening solutions and positions us as a pioneer in the Danish market. Join it in making a positive impact on the environment, one plant at a time.

LiveTrends Design Group has combined its products with its unique collection of indoor paper pots are handmade by a community of wonderful female artisans in Panadura, Sri Lanka. Through the Home Work Project, they are able to earn a living while caring for their families. The pots themselves are made out of 100 per cent recycled paper and coated with natural latex. They are watertight and will last for many years, but when you have finished with them, they are fully compostable.

Banderola - a wave of flowers

As a breeder, you are constantly focused on the long term. What will be the trends in ten years? What will pique the interest of the future generation? Which plant can truly grow with the times? These are the questions that gave rise to the Banderola® series. A graceful and refined segment of anthurium, ready to grow with the generation of tomorrow.

The flowers resemble graceful ribbons and blend harmoniously with the leaves in a playful manner. These charming plants produce a wave of flowers. Beautiful in large pot sizes but also highly suitable for smaller sizes. Timeless elegance in the colours red and white.

Banderola® Roja is the first red variant in this new series, distinguished by the abundant number of flowers per plant and its exuberant bloom. The ribbon-like shape of the flowers is prominently visible and truly sets this segment apart from the familiar Anthurium. The Roja enlivens your surroundings with its playful appearance while maintaining a classic touch with its deep red colour.

Banderola® Cava

The white variant in this new series exudes freshness. The name Cava is fitting: this plant sparkles just like the sparkling wine it's named after. With the exuberant bloom of the white, upright flowers and the dignified leaves, it's a charming presence. Festive and elegant, the plant is suitable for both serene aesthetics and celebratory occasions.

Banderola® Lava exudes warmth, and the ton-sur-ton colour scheme of the flower and the spathe enhances that feeling. The name Lava is chosen for a reason: as if the plant is glowing, the Lava is a fiery display. This passionate Anthurium evokes a pleasant sensation every time you pass by.

A powerful trio against fungus gnat larvae

Almost every area of horticulture is familiar with fungus gnats and their larvae. Especially seedling producers are afraid of them. Fungus gnat larvae are not choosy for roots, whether poinsettia, bedding and balcony plants, herbs, vegetables, hardwood cutting or herbaceous perennials, their diet includes all those roots. Chemical crop protection can hardly provide any possibilities for action. Therefore, it is great that biological plant protection can offer good alternatives to cultural and biological techniques (such as yellow catchboards for monitoring or drought stress).

The powerful trio consists of the nematodes *Steinernema feltiae*, the predatory mite *Hypoaspis miles* and a BTI. *Steinernema feltiae* are threadworms that are being poured into the plants. They are either contained in clay granules and then dissolved in water or they are poured as ice nematodes. *Hypoaspis miles* lives on the soil and, besides fungus gnats larvae, also eats thrips and springtails.

They are being scattered onto the plant substrate in the carrier material, a mixture of vermiculite and soil. *Bacillus thuringiensis israelensis* (BTI) is being poured. The methods described are used preventively in the first week after seeding, pricking, plugging or planting and should be, according to the requirements of the plant culture, pursued continuously.

Grafted Hot Peppers

Hishtil's grafted hot pepper plants are sharp flavoured, vibrant and beautiful and help increase yields.

The product list of grafted hot pepper plants includes the following types:

- Capsicum hot pepper 'Magnum' (Habanero) Grafted
- Capsicum hot pepper 'Maya' (Habanero) Grafted
- Capsicum hot pepper 'Touro' (Jalapeno) Grafted
- Capsicum hot pepper 'Budapest' (Hungarian) Grafted
- Capsicum hot pepper 'Fire Flame' (Chili) Grafted
- Capsicum hot pepper 'Dorset Naga Red' (Morch) Grafted
- Capsicum hot pepper 'Jamaican Yellow' (Scotch) Grafted
- Capsicum hot pepper 'Big Devil' (Chili) Grafted

Like other grafted vegetable plants, grafted hot peppers have proven to be superior performers, having robust growth, longer fruiting and higher resistance to soil disease. Benefits outweigh costs when factoring in an increase in yield and a reduction in chemicals for disease prevention. These advantages make them clear favourites for commercial growers and home gardeners alike.

Geyser Nebulizer E-25 MI 21 V

The Geyser Nebulizer E-25 MI 21 V is the ideal solution for those who want to get rid of unwanted guests such as mosquitoes, pigeons and bad smells.

The nebulizer works automatically and safely: the intuitive display with clock on the front of the machine allows the frequency, power and duration of the cycles to be set. The 30-second acoustic timer signals the machine's start-up, thus giving the possibility to walk away before the ultra-fine nebulization treatment. It also offers the possibility of setting the start time of cycles, thus allowing greater flexibility.

The Geyser Nebulizer E-25 MI 21 V is compatible with the 2.6 Ah and 4 Ah batteries of the power line 21 V. The battery is not included, so you can independently choose the best one for your needs, or use the one you already have.

Thanks to the battery power supply, you can easily position the Geyser Nebulizer E-25 MI 21 V in the strategic locations of your choice, also thanks to the practical aluminium tripod.

The motor allows you to manage the two power levels and a high working pressure. Choosing the level best suited to your needs will save battery power. Autonomy varies depending on the battery used.

The recommended battery for this product is 2.6 Ah / 21.6 V. This battery allows continuous work of up to approximately 180 minutes on power level 2.

The three ultra-fine nebulization nozzles allow for a homogeneous distribution of the product at 360 degrees, for greater effectiveness of the treatments. The special FPM seals make it suitable even for the use of the most aggressive products. The innovative internal nozzle allows optimal mixing of any product used.

The nebulizer can also be used for the disinfection of indoor environments and for the nebulization of other liquids.

Technical specifications

Tank capacity: 25L

Maximum working pressure: 5 bar

Water flow: 0.12 litres per minute

Power Line 21V compatibility

Pot Roses with enchanting Fragrance

The Queen of Pot Roses – the international acknowledged rose breeder Rosa Eskelund from Roses Forever – presents a brand-new series of long-lasting fragrant pot roses with large flowers.

Pot roses with fragrance are very difficult to breed, and when you add long life of minimum three weeks and large flowers, you really have a challenge ahead of you.

Nevertheless, rose breeder Rosa Eskelund took up the challenge and after ten years of breeding she is now ready to present four amazing varieties with large fragrant flowers and a beautiful dark green foliage. All four new varieties have a very pleasant fragrance with large long-lasting flowers and are for both indoor and outdoor use, so Rosa Eskelund, who already has been breeding a long line of international bestsellers sold under the brand names Infinity® Roses, Roses Forever® and Love Forever®.

Four new varieties

The new varieties will be marketed under the brand name *Love Fragrance Forever*. The new varieties are all ready for the market from March 2019.

Stop and smell the Roses

Rosa Eskelund is a breeder with passion for her roses. That is also why her new fragrant pot roses will be presented under the slogan *Stop and smell the Roses*. "I heard this expression about *Stop and smell the Roses* some time ago. It is so true, because we all live busy lives, and it is important sometimes to "*stop and smell the roses*" and see our lives with a deeper appreciation of the world around us. It can help us to slow down and be aware of all the little things that makes life so beautiful. It is more than ever important to take a break and be present in the moment; otherwise those moments will pass you by", says Rosa Eskelund.

Hyperion™ Greenhouse LED grow light

Plessey Semiconductors have specifically designed the Hyperion™ grow light to deliver greater returns for commercial growers. The Hyperion™ grow light can work alongside or can replace high pressure sodium grow lights. With Hyperion™ you need less units for any given lighting installation than with competitor LED grow lights. Being 1:1 equivalent with existing 1000w and 600w sodium grow lights makes Hyperion™ easy to install and to use for growers, installers and greenhouse builders.

Key features

Up to 1800 µmol/s and 1000 µmol/s light output options

Equivalent to 1000w and 600w sodium grow lights

Up to 40 per cent energy saving versus sodium

Up to 3.0 µmol / joule efficacy (after driver and optical losses)

100 per cent LED or hybrid with HPS installation

Key features continued

IP66 rated for full pressure power wash cleaning

IP68 rated fan on Hyperion™ 1750. Dust tight and prolonged immersion

Range of proven spectrums for different applications

Tailor-made spectrum to suit grower requirement

Low shading and installation costs

Five years guarantee/ 25,000 hours

Leasing options

Benefits

Fewer units required per install than any competitor LED fixtures

Less overall shading than any competitor LED fixtures

Lower installation costs

Install on existing trellis to avoid extra c-profile cost and shading

Greater flexibility on lighting design and positioning

Even light distribution possible between 5 metre poles

Options

Reflector accessory to ensure uniformity at the edge of installations

Mairol universal fertilizer Groth Crystals

Growth crystals for dissolving in water: Mineral universal fertilizer for all green plants, which is much more efficient than a liquid fertilizer solution (1 gram for 1 liter of water). Especially recommended during the growing season.

Mairol Growth Crystals is a high-quality professional fertilizer in crystal form for dissolving in water. This crystal fertilizer is for indoor, balcony, patio and garden plants. The proven and valued formula ensures healthy and lush growth and intensive green coloration. The universal fertilizer strengthens overall plant growth and promotes root formation, which is particularly important in spring as a starter fertilizer to revitalize plants.

Mairol Growth Crystals is a particularly rich universal fertilizer that strengthens plants and ensures healthy growth. Also suitable for top dressing.

Mairol Growth Crystals optimally supplies plants with nitrogen, phosphate, potassium oxide and important trace elements such as magnesium, boron, copper, iron, manganese, molybdenum and zinc. The nutrient component mix is easily absorbed by plants.

The result of Mairol fertilizers inspires long-standing customers worldwide. Quality made in Germany since 1920. As important as water - that's what sets Mairol apart.

Weishaupt WM-series monarch® burners for the simultaneous combustion of natural gas and biogas

Weishaupt monarch® (WM) burners are compact, powerful, and quiet. They can be employed on hot-water boilers, steam boilers, air heaters, and some thermal process applications.

Weishaupt's WM-series gas and dual-fuel burners are equipped with electronic compound regulation and digital combustion management as standard. This allows for the simultaneous combustion of two fuels, such as natural gas and biogas, which both utilises renewable energies and reduces peak loads on the public gas network.

On-the-fly fuel changeover without an intervening burner shutdown and restart is possible, as is individual and simultaneous combustion or other customer-tailored solutions.

SmartStaff - the best staff ever

Finding and retaining good staff is quite a challenge. Looking for suitable people takes up time and money.

With SmartStaff from WPS, you will get the best staff you'll ever have.

Integrated logistic system

SmartStaff consists of five modules that put the plants in the trays, wrap them, label them and get them ready for transport. Fully automatic and without any human intervention.

All the modules are designed to integrate perfectly with each other as well as the rest of your system.

Easy to integrate seamlessly into existing WPS systems, both in terms of the hardware and software.
