

FOR HORTICULTURE AND REFORESTATION

MULCH TRAY WITH OR WITHOUT WATER RESERVE

For the cultivation of plants in pots from 2 litres to 30 litres, cultivation directly in the ground and reforestation.

A. UPPER SECTION Mulch tray figure 1

A perforated tray covers and overlaps the top of the pot. This part is split and can be opened to enable it to be positioned around the plant. Slits on the top of the mulch tray let the water through and distribute it slowly over the entire surface of the pot. Fertilizer and plant care products can be placed there. The mulch tray can be used without the water reserve.

B. LOWER SECTION Water reserve figure 2

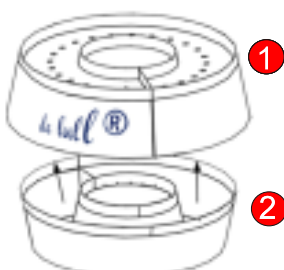

It covers the compost and surrounds the base of the plant. This part is split and can be opened to enable it to be positioned around the plant. It collects irrigation water and distributes it slowly over the entire surface of the compost through micro-holes. Fertilizer and plant care products can be placed there. For reforestation, it is placed around the sapling and is covered with mulch.

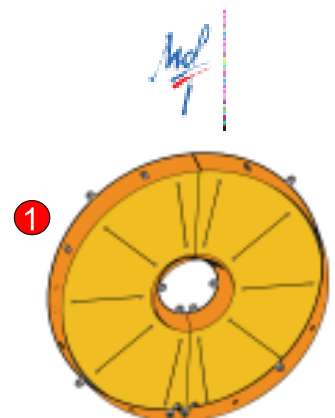

AVAILABLE IN GARDEN CENTRES for terraces and balconies.

de lull®

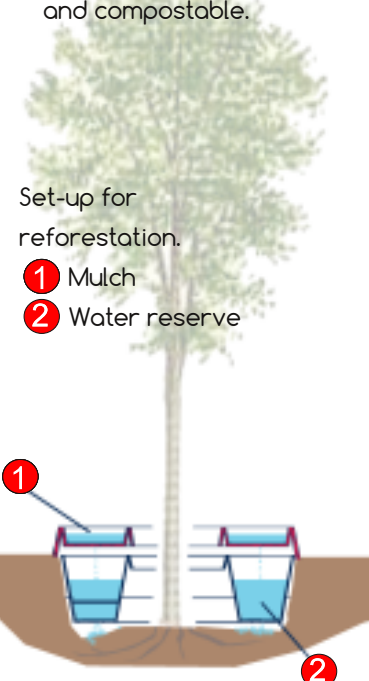

Made in France.

Water reserve for reforestation.
15 L. biodegradable and compostable.

Set-up for reforestation.

- 1 Mulch
- 2 Water reserve

ADVANTAGES OF MULCH:

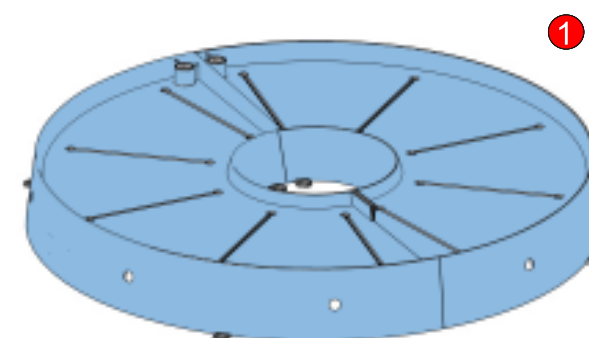

55 % SAVING WATER.

- Prevents grass and weeds growing.
- Eliminates the need for manual and chemical weed control
- Helps to protect against temperature variations.
- Prevents any water evaporation and the drying out of the substrate surface.
- Slowly distributes water over the pot's entire surface.
- Prevents loss of soil and fertilizer when pots fall over during cultivation or during transport.
- Contributes to uniform development of the roots in the pot and protects them against frost, sun and wind.
- Enables the top of the pot to be kept clean.
- Several colours available *separation of varieties *separation of customers' orders (better stock management) *better presentation and enhanced quality.
- Enables faster and more balanced growth of equipped plants.

BENEFITS FOR HORTICULTURE

Manual installation and removal of the mulch is fast and can be done at any stage of cultivation, it can be mechanized at repotting (with a specially designed automated system). Enables considerable savings in labour, and substantial savings in water and other products. Can be used for several seasons. Any shape possible to order.

Faster and more generous growth of plants equipped with mulch trays.

de lull® mulch trays can also used for cultivation directly in the ground : Flowers, fruit, vegetables, olives, vines etc., and all types of reforestation.

Made in PP (polypropylene recycled and recyclable) and in biodegradable and compostable for reforestation.
